# **ENERGY**

## **A Continuing Bibliography**

### **With Indexes**

#### **Issue 16**

A selection of annotated references to unclassified reports and journal articles that were introduced into the NASA scientific and technical information system and announced from October 1 through December 31, 1977 in

- *Scientific and Technical Aerospace Reports (STAR)*
- *International Aerospace Abstracts (IAA)*

This Supplement is available from the National Technical Information Service (NTIS), Springfield, Virginia 22161, at the price code E05 (\$9 00 domestic, \$18 00 foreign)

# INTRODUCTION

This issue of *Energy A Continuing Bibliography with Indexes* (NASA SP-7043(16)) lists 1287 reports, journal articles, and other documents announced between October 1, 1977 and December 31, 1977 in *Scientific and Technical Aerospace Reports (STAR)* or in *International Aerospace Abstracts (IAA)*. The first issue of this continuing bibliography was published in May 1974 and succeeding issues are published quarterly.

The coverage includes regional, national and international energy systems; research and development on fuels and other sources of energy; energy conversion, transport, transmission, distribution and storage, with special emphasis on use of hydrogen and of solar energy. Also included are methods of locating or using new energy resources. Of special interest is energy for heating, lighting, for powering aircraft, surface vehicles, or other machinery.

Each entry in the bibliography consists of a standard bibliographic citation accompanied in most cases by an abstract. The listing of the entries is arranged in two major sections, *IAA Entries* and *STAR Entries* in that order. The citation, and abstracts when available, are reproduced exactly as they appeared originally in *IAA* or *STAR* including the original accession numbers from the respective announcement journals. This procedure, which saves time and money accounts for the slight variation in citation appearances.

Five indexes -- subject, personal author, corporate source, contract number, and report number -- are included. The indexes are of the cumulating type throughout the year, with the fourth quarterly publication containing abstracts for the fourth quarter and index references for the four quarterly publications.

# AVAILABILITY OF CITED PUBLICATIONS

## IAA ENTRIES (A77-10000 Series)

All publications abstracted in this Section are available from the Technical Information Service American Institute of Aeronautics and Astronautics, Inc (AIAA), as follows. Paper copies are available at \$6.00 per document up to a maximum of 20 pages. The charge for each additional page is 25 cents. Microfiche<sup>(1)</sup> are available at the rate of \$2.50 per microfiche for documents identified by the # symbol following the accession number. A number of publications, because of their special characteristics, are available only for reference in the AIAA Technical Information Service Library. Minimum airmail postage to foreign countries is \$1.00. Please refer to the accession number, e.g., (A77-10121) when requesting publications.

## STAR ENTRIES (N77-10000 Series)

One or more sources from which a document announced in *STAR* is available to the public is ordinarily given on the last line of the citation. The most commonly indicated sources and their acronyms or abbreviations are listed below. If the publication is available from a source other than those listed, the publisher and his address will be displayed on the availability line or in combination with the corporate source line.

Avail NTIS. Sold by the National Technical Information Service. Prices for hard copy (HC) and microfiche (MF) are indicated by a price code followed by the letters HC or MF in the *STAR* citation. Price codes are given in the tables on page vii of the current issue of *STAR*.

Microfiche<sup>(1)</sup> is available regardless of age for those accessions followed by a # symbol.

Initially distributed microfiche under the NTIS SRIM (Selected Research in Microfiche) is available at greatly reduced unit prices. For this service and for information concerning subscription to NASA printed reports, consult the NTIS Subscription Unit.

**NOTE ON ORDERING DOCUMENTS.** When ordering NASA publications (those followed by the \* symbol), use the N accession number. NASA patent applications (only the specifications are offered) should be ordered by the US-Patent-Appl-SN number. Non-NASA publications (no asterisk) should be ordered by the AD, PB, or other *report* number shown on the last line of the citation, not by the N accession number. It is also advisable to cite the title and other bibliographic identification.

Avail SOD (or GPO). Sold by the Superintendent of Documents, U.S. Government Printing Office, in hard copy. The current price and order number are given following the availability line. (NTIS will fill microfiche requests, at the standard \$3.00 price, for those documents identified by a # symbol.)

Avail NASA Public Document Rooms. Documents so indicated may be examined at or purchased from the National Aeronautics and Space Administration, Public Documents Room (Room 126) 600 Independence Ave. S.W., Washington, D.C. 20546, or public document rooms located at each of the NASA research centers, the NASA Space Technology Laboratories, and the NASA Pasadena Office at the Jet Propulsion Laboratory.

(1) A microfiche is a transparent sheet of film 105 by 148 mm in size containing as many as 60 to 98 pages of information reduced to micro images (not to exceed 26:1 reduction).

- Avail. ERDA Depository Libraries** Organizations in U S cities and abroad that maintain collections of Energy Research and Development Administration reports, usually in microfiche form, are listed in *Nuclear Science Abstracts* Services available from the ERDA and its depositories are described in a booklet, *Science Information Available from the Energy Research and Development Administration* (TID-4550), which may be obtained without charge from the ERDA Technical Information Center
- Avail Univ Microfilms** Documents so indicated are dissertations selected from *Dissertation Abstracts* and are sold by University Microfilms as xerographic copy (HC) and microfilm All requests should cite the author and the Order Number as they appear in the citation.
- Avail USGS** Originals of many reports from the U S Geological Survey, which may contain color illustrations, or otherwise may not have the quality of illustrations preserved in the microfiche or facsimile reproduction, may be examined by the public at the libraries of the USGS field offices whose addresses are listed in this introduction The libraries may be queried concerning the availability of specific documents and the possible utilization of local copying services, such as color reproduction
- Avail HMSO** Publications of Her Majesty's Stationery Office are sold in the U S by Pendragon House, Inc (PHI), Redwood City, California The U S price (including a service and mailing charge) is given, or a conversion table may be obtained from PHI
- Avail BLL (formerly NLL)** British Library Lending Division, Boston Spa, Wetherby, Yorkshire, England Photocopies available from this organization at the price shown (If none is given, inquiry should be addressed to the BLL)
- Avail ZLDI.** Sold by the Zentralstelle für Luftfahrtokumentation und -Information, Munich, Federal Republic of Germany, at the price shown in deutschmarks (DM)
- Avail. Issuing Activity, or Corporate Author, or no indication of availability** Inquiries as to the availability of these documents should be addressed to the organization shown in the citation as the corporate author of the document.
- Avail: U.S Patent Office** Sold by Commissioner of Patents, U S Patent Office, at the standard price of 50 cents each, postage free
- Other availabilities** If the publication is available from a source other than the above, the publisher and his address will be displayed entirely on the availability line or in combination with the corporate author line

## **GENERAL AVAILABILITY**

All publications abstracted in this bibliography are available to the public through the sources as indicated in the *STAR Entries* and *IAA Entries* sections. It is suggested that the bibliography user contact his own library or other local libraries prior to ordering any publication inasmuch as many of the documents have been widely distributed by the issuing agencies, especially NASA. A listing of public collections of NASA documents is included on the inside back cover.

## **SUBSCRIPTION AVAILABILITY**

This publication is available on subscription from the National Technical Information Service (NTIS). The annual subscription rate for the quarterly supplements is \$45.00 domestic, \$75.00 foreign. All questions relating to the subscriptions should be referred to NTIS, Attn: Subscriptions, 5285 Port Royal Road, Springfield Virginia 22161.

## TYPICAL CITATION AND ABSTRACT FROM STAR

## TYPICAL CITATION AND ABSTRACT FROM IAA

## **A Listing of Energy Bibliographies Contained In This Publication:**

1. An annotated bibliography, volume 1, appendix 2 p0513 N77-28577
2. An annotated bibliography, volume 2, appendix 2 p0513 N77-28578
3. Solar cells and solar panels p0529 N77-30621
4. Health effects of pollutants associated with fossil-fuel power generation An indexed bibliography with abstracts p0540 N77-31672
5. In-situ coal gasification: Status of technology and environment impact p0548 N77-32613
6. Reclamation of energy from solid waste: Theory and practice. A selected, annotated bibliography for Pennsylvania local government officials p0555 N77-33621

JANUARY 1978

### IAA ENTRIES

**A77-40512** Perspectives of geothermal energy in France (Perspectives de la géothermie en France). C Ruhla (Lyon I, Université, Lyons, France) *Sciences et Techniques*, June 1977, p. 22-28. In French

The feasibility of utilizing geothermal energy from low-grade (about 70 C) sources in France is considered. The geothermal flux in impermeable rock is calculated to be 0.0606 W/sq m, the ratio of the average geothermal flux to the average solar flux (1 16,500) is so low as to severely limit the development of this resource. Examination of a hypothetical reinjection system for tapping energy from the Dogger basin indicates that this source would be rapidly exhausted, renewal time is calculated to be 2000 years. However, theoretical analyses indicate that geothermal energy could be effectively used to heat private residences, in this capacity it has a major advantage over solar heat in that installation of geothermal heating systems does not necessitate radical modification of existing structures. The principals used in the analysis will be demonstrated in the Creil installation, in which geothermal energy will be used to heat 4000 residences. C K D

**A77-40519** Solar power in space - Energy for the year 2000. *Interavia*, vol 32, July 1977, p. 684-686

Solar energy, a clean and practically inexhaustible source of power, may become an increasingly attractive alternative to conventional sources as their costs rise. NASA's current studies of the economic and technical feasibility of space solar power emphasize development of a collector, 25 by 5 km, located in geosynchronous orbit at about 36,000 km above the earth. No atmospheric interference would occur at that position, and the collector could provide uninterrupted power to a given location on earth. Needed to implement this design are improved solar cells (silicon devices being the most promising candidates), research into problems of microwave transmission at high power levels, development of construction techniques in space; and availability of an orbital transfer vehicle and space shuttle systems with high payloads. Estimates of eventual costs at 30-115 mills (tens of thousandths of a cent) per kilowatt hour indicate that the concept is worthy of further investigation. J.M.B.

**A77-40523** # Problems in the use of oil shale as an energy source (Problemy energeticheskogo ispol'zovaniia goriuchikh slantsev). I. P. Epik. *Energetika*, vol 20, Apr. 1977, p. 54-61. 6 refs. In Russian

The paper discusses the development of oil shale exploitation and use in the USSR, some problems in connection with the operation of shale oil-burning steam generators, the problem of the emissions from a shale oil power plant, and the possibilities of further processing of shale oil combustion products for fertilizer and building material production. Soviet plans call for a reduction in the use of Baltic oil shale as an energy source in the years 1976-1980, but also for the development of an experimental facility in Estonia for shale oil processing in combination with oil processing for obtaining fertilizer and building material. P T H

**A77-40553** Photoelectrolysis with YFeO<sub>3</sub> electrodes. M A Butler, D S Ginley (Sandia Laboratories, Albuquerque, N Mex.), and M Eibschutz (Bell Telephone Laboratories, Inc., Murray Hill, N.J.) *Journal of Applied Physics*, vol 48, July 1977, p. 3070-3072. 13 refs. Contract No. AT(29-1)-789

The investigation is related to the possibility to use the photoelectrolysis of water with illuminated semiconducting electrodes as a means of solar energy conversion. Butler and Ginley (1977) have shown that a smaller electron affinity for the photoanode results in improved zero bias operation. The considered model predicts that the rare-earth orthoferrites should have improved zero bias operation characteristics over Fe<sub>2</sub>O<sub>3</sub>. A description is presented of studies which show that this is actually the case. The studies include the determination of the photoresponse of YFeO<sub>3</sub> anodes. The data indicate an indirect optical gap of 2.58 eV. It is found that the general behavior of YFeO<sub>3</sub> photoanodes is promising for the practical conversion of solar energy to chemical energy. G R

**A77-40567** CuInS<sub>2</sub> thin-film homojunction solar cells. L L Kazmerski and G A Sanborn (Maine, University, Orono, Me.) *Journal of Applied Physics*, vol 48, July 1977, p. 3178-3180. 17 refs. NSF-ERDA-supported research

The fabrication and characteristics of n,p-CuInS<sub>2</sub> thin film homojunction solar cells are presented. Dark and light I-V characteristics are reported for a 0.124 sq cm device with an efficiency of 3.33%, open circuit voltage of 0.41V, short circuiting current = 2.34 mA, and a fill factor of 0.43. A best efficiency of 3.62% is cited. An examination of the forward dark lnJ vs V characteristics indicates that the recombination-generation mechanism at the junction dominates the device operation. The spectral characteristics are presented and indicate a maximum near the wavelength (0.8 micron) corresponding to the energy gap of CuInS<sub>2</sub>, with a relatively low quantum efficiency (less than 0.45). The stability and limitations of this photovoltaic device are discussed. (Author)

**A77-40568** Upper limit of efficiency for photovoltaic solar cells. C. D. Mathers (Sydney, University, Sydney, Australia) *Journal of Applied Physics*, vol 48, July 1977, p. 3181, 3182. 7 refs.

A theoretical upper limit of efficiency is obtained for a photovoltaic solar cell which uses a semiconductor with a single energy gap. This limit is not based on a particular material or type of device and may be used with any solar or absorption spectrum. (Author)

**A77-40591** Threshold capabilities of a pulsed MHD converter for the production of electric power with a resistive load. E I Asinovskii and V E Ostashev (Akademiia Nauk SSSR, Nauchno-Issledovatel'skii Institut Vysokikh Temperatur, Moscow, USSR) (*Teplotfizika Vysokikh Temperatur*, vol 14, Sept-Oct 1976, p. 1079-1082.) *High Temperature*, vol 14, no 5, Mar 1977, p. 956-959. 6 refs. Translation

**A77-40644** Hydrogen peroxide emission levels from a hydrogen fueled combustion engine. K S Varde (Michigan, University, Dearborn, Mich.) and D K Lewis (Colgate University, Hamilton, N.Y.) *Air Pollution Control Association, Journal*, vol 27, July 1977, p. 678, 679. Research supported by the American Chemical Society and Sloan Foundation

**A77-40647** Solar thermal electricity - Power tower dominates research W D Metz *Science*, vol 197, July 22, 1977, p 353-356

The Energy Research and Development Administration (ERDA) has tended to favor development of centralized solar thermal generating plants at the expense of smaller scale intermediate-temperature systems, though, according to a report from the Office of Technology Assessment (OTA), the large solar electric plant, such as the 'power tower' presently being promoted by ERDA and the Electric Power Research Institute (EPRI), may not necessarily produce energy more efficiently than small on-site facilities. Features and costs of the heliostats being designed for the 'power tower' by various companies are compared. Subsidiary problems in developing the 'power tower', including design of the boiler, and construction of the tower itself are also discussed. J M B

**A77-40648 \*** Mining the Apollo and Amor asteroids B. O'Leary (Princeton University, Princeton, N.J.). *Science*, vol 197, July 22, 1977, p 363-366 42 refs Grant No. NSG-2062

Earth-approaching asteroids could provide raw materials for space manufacturing. For certain asteroids the total energy per unit mass for the transfer of asteroidal resources to a manufacturing site in high earth orbit is comparable to that for lunar materials. For logistical reasons the cost may be many times less. Optical studies suggest that these asteroids have compositions corresponding to those of carbonaceous and ordinary chondrites, with some containing large quantities of iron and nickel; other are thought to contain carbon, nitrogen, and hydrogen, elements that appear to be lacking on the moon. The prospect that several new candidate asteroids will be discovered over the next few years increases the likelihood that a variety of asteroidal resource materials can be retrieved on low-energy missions. (Author)

**A77-40673** Strategy of pollution control P M Berthouex and D F Rudd (Wisconsin University, Madison, Wis.) New York, John Wiley and Sons, Inc., 1977 585 p 36 refs \$18.95

The environmental system is examined and an analysis of material and energy flow is conducted, taking into account the hydrologic cycle, the preservation of water quality, nutrient cycles, population dynamics, the conservation of mass, material balancing with chemical transformation, the arithmetic equivalence of energy forms, the conversion equivalence of energy forms, the heat trap, the energy cost of fuel, energy and food, the production of industrial chemicals and materials, and energy and pollution control. Attention is also given to the strategic use of industrial chemistry, the processing with living organisms, separation systems, aspects of systems integration, and policy studies. G R

**A77-40682** Hydrocarbon deposits beyond the shelf edge of the oceans (Kohlenwasserstoffvorkommen jenseits der Schelfkante der Ozeane). W Schott (Bundesanstalt für Geowissenschaften und Rohstoffe, Hanover, West Germany) *Erdöl und Kohle Erdgas Petrochemie vereinigt mit Brennstoff-Chemie*, vol 30, June 1977, p 251-256 56 refs In German

An investigation is conducted concerning the prospects for an occurrence of petroleum and natural gas deposits on the ocean floor beyond the continental shelf in the deep ocean regions, taking into account the geological characteristics of the ocean floor related to sediment formation. It is found that the geological structure of the continental margins is frequently affected by the geological conditions on the adjacent mainland. The presence of hydrocarbon deposits on the ocean floor beyond the edge of the 'Atlantic' continental shelves is, therefore, to be expected. Possibilities regarding an economic exploitation of the existing resources will depend on the magnitude of these resources and technological factors related to the development of suitable equipment. With respect to the 'Pacific' Ocean regions, the currently available information is not yet sufficient for predictions concerning the occurrence of hydrocarbon deposits in the involved areas. G R

**A77-40683** Energy forecasts yesterday and today (Energieprognosen gestern und heute) H Elfert (Esso AG, Hamburg, West Germany) *Erdöl und Kohle Erdgas Petrochemie vereinigt mit Brennstoff-Chemie*, vol 30, June 1977, p 281-285 11 refs In German

Energy forecasts made in the past are considered, taking into account an investigation by Sandner (1972) who has found that during the time from 1955 to 1972 estimates regarding the growth of primary energy consumption were generally too low. Studies related to the availability of energy have become predominant since 1973. The problem of an evaluation of energy programs is investigated. Attention is also given to the limited reliability of the methods used in current energy forecasts, difficulties regarding a quantification of forecast data, and the consideration of alternative solutions in the study of energy supply problems. G R

**A77-40686** Electrochemical energy conversion II - Utilities, marine and space applications. F Hirschfeld *Mechanical Engineering*, vol 99, July 1977, p 28-34

Development and potential uses for some electrochemical cells are discussed. Stabilized zirconia, displaying good ionic conductivity at a temperature above 1200 K may be utilized for high temperature electrochemical processing in fuel cells and electrolysis cells, furthermore, when coupled with a low-temperature fuel cell, the zirconia battery can operate as an electrical generator. A planar bipolar cell stack and mixed conductors are suggested solutions for the design problems of high-temperature cells. The high-temperature zirconia cell and the high-temperature lithium-iron sulfide battery both have applications in electric utility load-leveling and in electric vehicle propulsion. A high-temperature lithium-inorganic cell, having a long operating life and capable of being pressure-equalized for deep ocean applications, is also considered. Improvements have been instituted in nickel-cadmium batteries, incorporating the superior gas recombination faculty of nickel-hydrogen systems, thus offering greater reliability and significant increase in cycle life capability. J M B.

**A77-40893** California's aqueduct offers peaking power to Los Angeles E Jeffs *Energy International*, vol 14, July 1977, p 17-19

The Castaic hydroelectric power project near Los Angeles, designed to recover energy expended in pumping water over the Tehachapi mountains, is described. The seven-unit plant makes use of water brought from Pyramid Lake (785 m above sea level) to Castaic Lake (462 m above sea level) by means of the 11.6 km Los Angeles tunnel. Pumped storage allows the plant to be used as a peak energy source in addition to operating as a spinning reserve without compromising the water supply. The machines are of the reversible Francis type. They are designed to operate as pumps under a dynamic head of 325 m on a rating of 238 MW, and under a 296 m head with a rating of 261 MW. The generator/motor units are of the modified umbrella type with a rating of 250 MVA. C K D.

**A77-41201 #** Explosion compression of plasma up to critical values of thermonuclear microfusion I, II S Kaliski (Polska Akademia Nauk, Instytut Podstawowych Problemow Techniki, Warsaw, Poland) *Journal of Technical Physics*, vol 18, no 1, 1977, p 3-16 13 refs

It is suggested that the critical parameters of thermonuclear microfusion can be obtained by a classical explosion method in a concentric compression system with a profiled explosion pulse converging at the center. The theoretical approach has been verified by experiments with a cylindrical system. Critical densities of D-T were obtained by an explosion procedure across a gas layer. The success of the explosion compression technique (and variants) is interpreted as making more feasible the production of thermonuclear microfusion by a combination of the explosion method with relatively weak sources of laser energy. M L

**A77-41211** Effects of coal mining on ground and surface water quality, Monongalia County, West Virginia. R G Corbett

(Akron, University, Akron, Ohio) (*American Association for the Advancement of Science, Symposium on Elemental Pathways from Rocks to Man, Boston, Mass Feb 1976*) *Science of the Total Environment*, vol 8, July 1977, p 21-38 19 refs Research supported by the U S Department of the Interior and University of Akron

**A77-41257** New developments on VW-PCI and VW-PCV stratified charge engine concepts (Über neuere Arbeiten am VW-PCI- und VW-PCV-Schichtladeverfahren) W Brandstetter *Motortechnische Zeitschrift*, vol 38, July-Aug 1977, p 327-330 17 refs In German Bundesministerium für Forschung und Technologie Contract No TV-7601-4

Two stratified charge engine concepts of the divided chamber type, namely the VW-PCI- (Pre-Chamber-Injection) and the VW-PCV-(Pre-Chamber-Valve) combustion process were developed and vehicle tested The main objective was to meet future exhaust emission standards while maintaining low fuel consumption Because of a number of advantages that were found for the PCI-process, such as lower NO(x) emissions for example, research efforts are concentrated in this direction In this paper, the influence of the degree of stratification is discussed Furthermore, the components for mixture formation and thermal exhaust aftertreatment are described (Author)

**A77-41258** The development of small regenerative gas turbines at MTU II (Die Entwicklung von Gasturbinen kleiner Leistung mit regenerativen Wärmetauschern in der MTU. II). W Heilmann and K Hagemeyer *Motortechnische Zeitschrift*, vol 38, July-Aug 1977, p 337-342 In German

In the first part of this contribution the design and construction principle of a gas turbine for commercial vehicle propulsion was described In the second part, the combined operation of drive unit is explained with reference to results from the test stand, concerning pressure and temperature distribution behind the turbine and before the regenerative heat exchanger, pressure losses and leakages in the whole system, and the temperatures of the bearings when the drive unit is being stopped Future developments with ceramic components are discussed (Author)

**A77-41316** Pyrolysis kinetics for oil-shale particles. B Granoff (Sandia Laboratories, Albuquerque, N Mex) and H E Nuttall, Jr (New Mexico, University, Albuquerque, N Mex) *Fuel*, vol 56, July 1977, p 234-240 13 refs ERDA-supported research

Experimental and mathematical investigations of the pyrolysis kinetics for single particles (12.7 mm diameter cylinders and spheres) of 22 gal/ton oil shale are presented Machined samples of uniform geometry were pyrolysed at 384-520 °C, while weight losses were continuously measured with a Cahn recording thermobalance Centerline temperature histories were obtained from samples instrumented with microthermocouples Other samples were partially pyrolysed, quenched, cross-sectioned and visually examined to aid in the understanding of the pyrolysis mechanism Two mathematical models were developed to represent the pyrolysis process A non-isothermal shrinking-core model was developed on the basis of observations of a shrinking-core mechanism in partially pyrolysed samples, an apparent pyrolysis activation energy of 110 kJ/mol was obtained A simplified, non-isothermal homogeneous model gave a pyrolysis activation energy of 148 kJ/mol It was shown that either model could account for the experimental centerline temperature histories and for the pyrolysis rates The non-isothermal homogeneous representation is considerably less complex than previously published pyrolysis models, and would be preferred for use as a subprogram in a comprehensive retorting model (Author)

**A77-41317** Coal particle integrity in high-temperature solvents, with and without agitation E G Plett, A C Alkidas, F E Rogers, and M Summerfield (Princeton University, Princeton, N J) *Fuel*, vol 56, July 1977, p 241-244 6 refs Research sponsored by the Mobil Research and Development Corp and Electric Power Research Institute

The physical characteristics of W Kentucky (bituminous) and Wyodak (subbituminous) coal particles after exposure to hydrogen-donor solvents at temperatures of 400-450 °C have been observed It is found that for exposures of up to 2 min, with pyridine extraction yields of up to 86% maf, particles do not disintegrate if no mechanical stresses are applied to them By contrast, with modest rates of stirring at 400 °C the particles do disintegrate at times as short as 2 min even with corresponding pyridine extraction yields of as low as 52% maf The mineral matter appears to comprise a major part of the physical skeletal structure which maintains particle integrity, in the absence of mechanical stresses, even after most of the organic matter has been removed (Author)

**A77-41318** Investigation into the use of large-scale total-energy systems in mild and warm climates F N Reale (Monash University, F N Reale and Associates, Clayton, Victoria, Australia) and T S Dillon (Monash University, Clayton, Victoria, Australia) *Fuel*, vol 56, July 1977, p 257-265 10 refs

An analysis of the economic feasibility of a large-scale (300 MW) total energy system, designed to provide energy for an idealized Australian city of about 100,000, is presented The system makes use of waste heat from coal-based electric power generation. An analysis of the heat energy requirements of a typical mix of industries indicates that about 35% of industrial heating load could be met by low-grade heat below 230 deg C Cost analyses show that it is possible to stage the development of a total-energy system so that capital outlays are distributed over an extended period of time Capital costs are found to be relatively insensitive to increases in demand for the first 15 years of development, however, sensitivity to this factor subsequently increases sharply, necessitating delay of decisions on final plant requirements until trends of industrialization and population growth are well established Efficiency of fuel utilization is climate-sensitive C K D

**A77-41319** Multi-stage activation of brown-coal chars with oxygen K Tomkow, T Siemienińska, A Jankowska, and F Czechowski (Wrocław, Politechnika, Wrocław, Poland) *Fuel*, vol 56, July 1977, p 266-270 11 refs

**A77-41321** Modelling of entrained-bed pulverized coal gasifiers S K Ubhayakar, D B Stickler, and R E Gannon (Avco Everett Research Laboratory, Inc., Everett, Mass) *Fuel*, vol 56, July 1977, p 281-291 28 refs Contract No EF-76-C-01-2015

An analytical model is formulated to describe the physical and chemical processes occurring in an entrained-bed pulverized coal gasifier The important processes considered are mixing of the cold coal-carrier-gas stream with the hot entraining gases, heat transport to the coal particles, the devolatilization of the coal particles to char and volatiles, the gas-phase reaction of these volatiles with the entraining gases and the thermal cracking of the volatiles outside the particles The solutions to the formulations are presented in the form of local properties as functions of particle residence time and inlet conditions Application of this model is exemplified by correlating it with the data obtained in an entrained-bed coal gasifier in which pulverized coal is injected into hot combustion gases to produce a fuel gas of low heating value (Author)

**A77-41351** The use of composite flywheels for braking energy recovery in road transport vehicles. R Bennison (Cambridge Consultants, Ltd., Cambridge, England) *Composites*, vol 8, July 1977, p 137, 138

An energy storage flywheel employing composite materials to improve vehicle acceleration and reduce energy requirements is described Differing ultimate tensile stress of a typical composite across and along the fibers necessitates a fiber-matrix arrangement that maximizes the energy-to-volume ratio while still providing convenience in wheel mounting, an elastomeric buffer between adjacent circumferential fiber layers is suggested to accommodate radial-expansion differences Fatigue properties of composites are found to be the limiting factor in setting the maximum rotational

speed of the wheel. To insure that the most fatigue-prone element of the composites, the resin matrix, does not destruct before the fiber layers under high stress, carbon fibers with a very low strain to failure rate are used. Other design problems include windage losses, which may be reduced by use of an evacuated chamber to enclose the assembly, the cost of protective housing, which may be minimized by engineering progressive instead of radical wheel failure.

**A77-41360 #** Physical principles underlying the conversion of concentrated solar energy with the aid of semiconductor photoconverters (Fizicheskie printsipy preobrazovaniia energii kontsentrirrovannogo solnechnogo izlucheniia s 'pomoshch'iu poluprovodnikovykh fotopreobrazovatelei). N S Lidorenko, V M Evdokimov, A F Milovanov, and D S Strebkov. *Akademiia Nauk SSSR, Izvestiia, Energetika i Transport*, May-June 1977, p 110-115 5 refs. In Russian

**A77-41361 #** Heat transfer and resistance in rotating pipes /Review/ (Teploobmen i soprotivlenie vo vrashchaiushchikhsia trubakh /Obzor/). B. S. Petukhov and A. F. Poliakov. *Akademiia Nauk SSSR, Izvestiia, Energetika i Transport*, May-June 1977, p 116-133 33 refs. In Russian

The article addresses the current state of the art and future outlook for research on heat transfer and resistance to heat flow in rotating pipes, in relation to cooling of electrical power machinery. Available data are cited, possible data improvements are discussed, and prospective problems are considered. Data acquired as coolants with virtually constant physical properties (except for density, varying with inertial forces) flow through the pipes were considered.

**A77-41422** Energy resources available to man. S Curran (Strathclyde, University, Glasgow, Scotland). *Physics in Technology*, vol 8, July 1977, p 138-143

An overview is presented of options in energy utilization, efficiency in resources exploitation for energy, safety and liabilities, and public acceptance. The use of vast amounts of stored energy in industrial societies is pointed out, and contrasted to the stable ecosystem and highly efficient use of replenishable (solar) energy by the Tsembaga (New Guinea). Alternative energy sources are outlined (energy in waves, earth's interior, wind, solar energy). Fast breeders are viewed as inherently safer than conventional reactors because of their smaller cores, lower coolant pressure, and easier containment. Disposal of radioactive wastes is deemed a manageable problem, and the often-discussed fears of nuclear vandalism and terrorism are 'overrated.'

**A77-41433** Analysis of the fill factor for n-CdS/p-CdTe solar cells. K W Mitchell, A L Fahrenbruch, and R H Bube (Stanford University, Stanford, Calif.) *Solid-State Electronics*, vol 20, July 1977, p 559-561 8 refs

**A77-41437** Sheet resistance component of series resistance in a solar cell as a function of grid geometry. N C Wyeth (Delaware, University, Newark, Del.) *Solid-State Electronics*, vol 20, July 1977, p 629-634 9 refs

Most photovoltaic solar cells use some type of light-transmitting grid electrode on the upper surface to reduce series resistance losses as the current is collected. The geometry of this grid is chosen through consideration of optical transparency and series resistance. A method of calculating the series resistance as a function of grid geometry is presented here with the following assumptions: (1) current generation is uniform over the area of the cell, (2) the thickness of the upper semiconductor layer is very much smaller than the lateral dimensions of the cell, (3) the resistance of the grid electrode is much less than the sheet resistance of the upper semiconductor layer, and (4) the current flow in the layer is ohmic. These assumptions will be satisfied for most solar cells of interest. The method is then applied to several representative grid geometries and the results are compared with previous calculations in the literature.

**A77-41448** Gasification - Theory and application. K. Littlewood (Sheffield, University, Sheffield, England). *Progress in Energy and Combustion Science*, vol. 3, no 1, 1977, p. 35-71 119 refs

The chemical aspects of the gasification of coal are examined, taking into account stoichiometry, gas composition, and thermodynamic and kinetic data. The physical aspects of gasification are considered and a description is provided of the gasification processes. Attention is given to gaseous fuels of low caloric value, producer gas, water-gas reactions, methane synthesis reactions, fundamental reactions, the use of steam, the blast saturation temperature, blast furnace gas, and gaseous fuels of medium caloric value. Methods for the production of synthesis gas are also discussed and developments in the production of substitute natural gas from coal are explored.

**A77-41516** Photovoltaic energy conversion using concentrated sunlight. E. L. Burgess (Sandia Laboratories, Albuquerque, N. Mex.) *Optical Engineering*, vol 16, May-June 1977, p 305-312 12 refs. Contract No. E(29-1)-789

This paper describes a development program which uses sunlight-concentration techniques to effect an immediate reduction in cost per unit power for photovoltaic systems in which solar-cell cost dominates the total system cost. Current examples of concentrator solar-cell technologies are single-crystal silicon and gallium arsenide. Implementation of cost reductions by the use of sunlight concentration is not dependent on the development of low-cost mass-production cell technologies, but emphasizes high cell efficiency and low-cost concentrator systems.

**A77-41551** New options in energy technology. *Proceedings of the Conference, San Francisco, Calif., August 2-4, 1977*. Conference sponsored by the American Institute of Aeronautics and Astronautics, Edison Electric Institute, and Institute of Electrical and Electronics Engineers. New York, American Institute of Aeronautics and Astronautics, Inc., 1977. 152 p. Members, \$20., nonmembers, \$27 50.

The contributions comprise an overview of the present status and developmental outlook of nonconventional and prospective energy sources. Practical advances bringing commercial implementation nearer, and cost analysis, are emphasized. Satellite solar power, ground-based solar power, hydrogen energy storage, energy storage in compressed air reservoirs, thermal energy storage, MHD systems combined with combustion of fossil fuels (particularly coal), fuel cells, electrochemical storage batteries, laser-induced fusion, Tokamak and other fusion reactors, wind power, ocean thermal energy conversion, and improved energy management in fossil fuel (coal, petroleum) systems are discussed in papers dedicated to each of those topics. Nitrogen oxide emissions control and a high-temperature helium gas-cooled reactor combined with a closed-cycle gas turbine are also discussed.

**A77-41552 #** Energy management for commercial buildings and cooling storage. F. Dubin (Dubin-Bloom Associates-Consulting

Engineers, New York, N.Y.), A. Rosenfeld (California, University, Berkeley, Calif.), and T. Simonson (Simonson and Simonson-Consulting Engineers, San Francisco, Calif.) In New options in energy technology, Proceedings of the Conference, San Francisco, Calif., August 2-4, 1977. New York, American Institute of Aeronautics and Astronautics, Inc., 1977, p. 1-3. 8 refs (AIAA 77-1004)

We estimate the feasibility and cost of installing chilled water storage in new buildings, so that electric chillers can be turned off during times of peak power demand. To replace a 100-ton chiller for 5 hours, the cost of thermal storage may be as low as \$250/ton, about half the cost of new gas turbines and distribution systems to supply the peak power. Cost of storage is presented as a function of chiller size. (Author)

**A77-41553 # Alternatives to oil and gas through energy management.** J. A. Belding (ERDA, Div. of Conservation Research and Technology, Washington, D.C.) In New options in energy technology, Proceedings of the Conference, San Francisco, Calif., August 2-4, 1977. New York, American Institute of Aeronautics and Astronautics, Inc., 1977, p. 4-11. 12 refs (AIAA 77-1006)

The vital importance of improved energy production and reutilization management in helping to meet energy needs is discussed in relation to short-term candidates for replacing petroleum and natural gas: solar power, nuclear power, and coal. Electric power utilities, transportation, large industry, commercial/residential uses are covered in relation to the problem addressed. Energy management, energy efficiency enhancement, conservation cost/benefits, cost-time analysis, investment in conservation, waste heat utilization, and applications of advanced fuel cells in major power systems are dealt with. R D V

**A77-41554 # Storage batteries - The case and the candidates.** J. R. Birk (Electric Power Research Institute, Palo Alto, Calif.) In New options in energy technology, Proceedings of the Conference, San Francisco, Calif., August 2-4, 1977.

New York, American Institute of Aeronautics and Astronautics, Inc., 1977, p. 12-16. (AIAA 77-1007)

The outlook for acceptance of batteries and improvements in batteries as sources of electric power for electrically actuated rail and municipal emergency power systems is assessed. Expected costs of various types of batteries (lead-acid, sodium-sulfur, sodium-antimony trichloride, lithium-metal sulfide, zinc-chlorine) as secondary power sources are discussed and compared with expected fuel costs. Present drawbacks of batteries are outlined (inadequate performance/operating life, high costs, repetitive cycling behavior, materials costs per kWh delivered). Battery applications in energy storage for various systems are considered. R D V

**A77-41555 # Compressed air energy storage.** K. G. Vossburgh (General Electric Co., Schenectady, N.Y.) In New options in energy technology, Proceedings of the Conference, San Francisco, Calif., August 2-4, 1977. New York, American Institute of Aeronautics and Astronautics, Inc., 1977, p. 17-25. 14 refs (AIAA 77-1008)

Compressed air energy storage (CAES) systems are being developed for peak load leveling applications by electric utilities. Energy is stored by compressing air in an underground reservoir, when power is required, the air is heated and expanded through a turbine-generator system. Several CAES plants are being designed, and construction of the first large scale plant will be completed late this year. From the specifications of these systems, it is concluded that CAES systems appear to be economically favored over gas turbines and other near-term utility storage systems for a substantial range of costs of fuel and off-peak charging power. (Author)

**A77-41556 \* # Thermal storage for electric utilities.** C. J. Swet (ERDA, Washington, D.C.) and W. J. Masica (NASA, Lewis Research Center, Cleveland, Ohio) In New options in energy

technology, Proceedings of the Conference, San Francisco, Calif., August 2-4, 1977. New York, American Institute of Aeronautics and Astronautics, Inc., 1977, p. 26-32. 17 refs (AIAA 77-1009)

Applications of the thermal energy storage (TES) principle (storage of sensible heat or latent heat, or heat storage in reversible chemical reactions) in power systems are evaluated. Load leveling behind the meter, load following at conventional thermal power plants, solar thermal power generation, and waste heat utilization are the principal TES applications considered. Specific TES examples discussed include storage heaters for electric-resistance space heating, air conditioning TES in the form of chilled water or eutectic salt baths, hot water TES, and trans-seasonal storage in heated water in confined aquifers. R D V

**A77-41557 # Utility views of MHD power generation.** C. H. Shih and M. K. Guha (American Electric Power Service Corp., New York, N.Y.) In New options in energy technology, Proceedings of the Conference, San Francisco, Calif., August 2-4, 1977. New York, American Institute of Aeronautics and Astronautics, Inc., 1977, p. 33-40. 14 refs (AIAA 77-1010)

Economic and ecological advantages of developing an open-cycle MHD process for generating electric power from MHD combustion of coal, without the use of turbines, rotating generators, or other moving parts absorbing energy, are discussed and listed explicitly. Higher efficiencies, low cost of electric power generated, far more manageable pollution problems, 50% less warm water effluents, inertialess startup and shutdown, reduced maintenance costs, and ability to handle all grades of coal without pretreatment (except for moisture removal) are cited as salient advantages. Elevated temperatures and use of highly corrosive potassium salts are examined for possible environmental impact. R D V

**A77-41558 # Improvement in phosphoric acid cell power-plant technology.** L. M. Handley, P. E. Grevstad, and D. R. McVay (United Technologies Corp., Power Systems Div., South Windsor, Conn.) In New options in energy technology, Proceedings of the Conference, San Francisco, Calif., August 2-4, 1977. New York, American Institute of Aeronautics and Astronautics, Inc., 1977, p. 41-50. (AIAA 77-1011)

An ERDA sponsored program has resulted in improvement in durability and cost of the phosphoric acid fuel cell power section and the fuel processor in a large, efficient first-generation electric utility powerplant. The program has served as a technology bridge between the 1.0-megawatt pilot plant tested at United's facility in early 1977 and the 4.8-megawatt demonstrator scheduled for delivery to a utility site in 1978. These powerplants are steps leading to commercial availability of the 27-megawatt FCG-1 for use in electric utility systems. (Author)

**A77-41559 # Economic assessment of the utilization of fuel cells in electric utility systems.** W. Wood, M. P. Bhavaraju, P. Yatchko (Public Service Electric and Gas Co., Newark, N.J.), and A. P. Fickett (Electric Power Research Institute, Palo Alto, Calif.) In New options in energy technology, Proceedings of the Conference, San Francisco, Calif., August 2-4, 1977. New York, American Institute of Aeronautics and Astronautics, Inc., 1977, p. 51-61. (AIAA 77-1012)

The long range economic benefits of first generation and advanced fuel cells in the future generation capacity plans of a representative electric utility system are evaluated. The benefits of fuel cells' unique characteristics are separately quantified and the relationships between market penetration, fuel price, and capital cost are analyzed utilizing reliability, production cost, and optimum generation mix methods commonly used for generation planning in utilities. (Author)

**A77-41560 # Gas turbine HTGR - A total energy utilization option.** A. J. Goodjohn (General Atomic Co., San Diego, Calif.) and S. H. Law (Northeast Utilities Service Co., Hartford, Conn.) In New

options in energy technology, Proceedings of the Conference, San Francisco, Calif., August 2-4, 1977 (A77-41551 19-44) New York, American Institute of Aeronautics and Astronautics, Inc., 1977, p. 63-67 11 refs Research supported by the General Atomic Co., Contract No. EY-76-C-03-0167 (AIAA 77-1016)

This paper considers the High-Temperature Gas-Cooled Reactor (HTGR) using high-pressure helium as the working fluid and a power conversion system that uses a closed-cycle gas turbine coupled directly to an electrical generator. The primary cycle is capable of yielding thermal-to-electrical efficiencies of 40% or higher. The heat rejected from the system is at a sufficiently high temperature to be effectively utilized without incurring penalties to the basic efficiency of the primary cycle. Moreover, the HTGR, by virtue of its basic core design, can yield high fertile-to-fissile conversion ratios, irrespective of the chosen fuel cycle, and thus can play a very important role in reducing the consumption rate of uranium resources (Author)

**A77-41561 # Adapting the experience of DOD/Industry to developing fusion power reactors** W C Gough (Electric Power Research Institute, Palo Alto, Calif.) and W B Briggs (McDonnell Douglas Astronautics Co., St. Louis, Mo.) In New options in energy technology, Proceedings of the Conference, San Francisco, Calif., August 2-4, 1977 New York, American Institute of Aeronautics and Astronautics, Inc., 1977, p. 69-75 (AIAA 77-1019)

Recent advances in controlled fusion research providing grounds for optimism are pointed out, and the program outlook for fusion power and management approaches to fusion reactor development are discussed. Contributions by the aerospace industry to fusion power development are discussed, comparisons between aerospace engineering design technology and needs of the fusion development program are cited (design to cost, scheduling and program milestones, simultaneous attention to basic physics, engineering design, cost, and performance) R D V

**A77-41562 # Integration of solar generation into electric utility systems** J W Ballance (Southern California Edison Co., Rosemead, Calif.) and G W Braun (ERDA, Washington, D.C.) In New options in energy technology, Proceedings of the Conference, San Francisco, Calif., August 2-4, 1977 New York, American Institute of Aeronautics and Astronautics, Inc., 1977, p. 76-83 (AIAA 77-1020)

The value of solar thermal power plants to an electric utility system has been determined. The relationship between solar power plant values and solar thermal storage levels, mix of other resources, and the level of solar generation in the system are described. The operating characteristics of solar generation are discussed, and strategies for optimizing the value of solar generation are described. Current maximum cost levels (in dollars) for solar generation are presented, and target levels for component costs are discussed (Author)

**A77-41563 \* # Silicon solar photovoltaic power stations.** C R Chowaniec (Westinghouse Electric Corp., East Pittsburgh, Pa.), R R Ferber (California Institute of Technology, Jet Propulsion Laboratory, Pasadena, Calif., Westinghouse Electric Corp., East Pittsburgh, Pa.), P F Pittman (Westinghouse Electric Corp., Pittsburgh, Pa.), and B W Marshall (Sandia Laboratories, Albuquerque, N. Mex.) In New options in energy technology, Proceedings of the Conference, San Francisco, Calif., August 2-4, 1977 New York, American Institute of Aeronautics and Astronautics, Inc., 1977, p. 84-89 (AIAA 77-1021)

Modular design of components and arrays, cost estimates for modules and support structures, and cost/performance analysis of a central solar photovoltaic power plant are discussed. Costs of collector/reflector arrays are judged the dominant element in the total capital investment. High-concentration solar tracking arrays are recommended as the most economic means for producing solar photovoltaic energy when solar cells costs are high (\$500 per kW generated). Capital costs for power conditioning subsystem compo-

nents are itemized and system busbar energy costs are discussed at length R D V

**A77-41564 # Perspectives on implementing OTEC power.** D. G. Jopling (Florida Power and Light Co., Miami, Fla.) In New options in energy technology, Proceedings of the Conference, San Francisco, Calif., August 2-4, 1977 New York, American Institute of Aeronautics and Astronautics, Inc., 1977, p. 90-96 (AIAA 77-1024)

Major problems confronting the development and commercialization of ocean thermal energy conversion (OTEC) are discussed, along with OTEC feasibility. The need for large extended heat exchangers and the high cost of such exchangers is focused on as a major problem, along with problems of corrosion and marine microbiofouling of the heat exchanger and other system equipment. Open or closed cycles, anchoring or sea surface grazing, component construction and assembly on the high seas, mooring during setup, and mechanical stresses at anchorage or en route to location are discussed. Advanced turbine and pump designs, bottoming cycles, new construction materials and techniques, and new heat transfer fluids and heat exchangers designs are envisaged as likely technological spinoffs from OTEC R D V

**A77-41565 # Implementation issues of wind energy.** U. Coty and L. Vaughn (Lockheed-California Co., Burbank, Calif.) In New options in energy technology, Proceedings of the Conference, San Francisco, Calif., August 2-4, 1977 New York, American Institute of Aeronautics and Astronautics, Inc., 1977, p. 97-105 (AIAA 77-1025)

Initial production quantities required by users (including developing nations), competitive energy cost criteria, and energy cost fractions are tabulated and compared. Availability of alternative energy sources, availability of incentives (financing by government or foreign loans), and availability of suitable high-wind sites are taken into account. Minimum investments and commitments to purchases of wind turbine generators to implement a wind power development program on a commercial are estimated R D V

**A77-41566 # Transmission of power from space to earth.** W. C. Brown (Raytheon Co., Lexington, Mass.) In New options in energy technology, Proceedings of the Conference, San Francisco, Calif., August 2-4, 1977 New York, American Institute of Aeronautics and Astronautics, Inc., 1977, p. 106-116 24 refs (AIAA 77-1026)

The transfer of energy from synchronous orbit to earth is accomplished by means of microwave power transmission. Microwave power transmission is a three-step process consisting of generation of microwave power from DC power, the formation of a highly collimated beam of microwaves for transmitting the power, and the capture and rectification of power at the earth end of the system. The technology fulfills the basic requirements for an efficient, reliable and safe system with power handling capability in the 5 - 10 GW region. The projected DC to DC system efficiency is 60%. A frequency in the 2 - 3 GHz region permits efficient power transfer through the earth's atmosphere. The devices used for energy conversion are described and their integration into a full scale system is discussed (Author)

**A77-41567 \* # Satellite solar power - Will it pay off.** G. A. Hazelrigg, Jr. (ECON, Inc., Princeton, N.J.) In New options in energy technology, Proceedings of the Conference, San Francisco, Calif., August 2-4, 1977 New York, American Institute of Aeronautics and Astronautics, Inc., 1977, p. 117-123 10 refs NASA-supported research (AIAA 77-1027)

A cost analysis is presented for front-end investments required for the development of a satellite solar power system. The methodology used makes use of risk analysis techniques to quantify the present state of knowledge relevant to the construction and operation of a satellite solar power station 20 years in the future. Results are used to evaluate the 'expected value' of a three-year

research program providing additional information which will be used as a basis for a decision to either continue development of the concept at an increasing funding level or to terminate or drastically alter the program. The program is costed phase by phase, and a decision tree is constructed. The estimated probability of success for the research and studies phase is 540. The expected value of a program leading to the construction of 120 systems at a rate of four per year is 12 433 billion dollars. C K D

**A77-41569 # Hydrogen by electrolysis to supplement pipeline gas supplies - Technical and economic aspects.** C R Guerra and W S Ku (Public Service Electric and Gas Co., Newark, N.J.) In New options in energy technology, Proceedings of the Conference, San Francisco, Calif., August 2-4, 1977. New York: American Institute of Aeronautics and Astronautics, Inc., 1977, p. 133-139. ERDA-sponsored research (AIAA 77-1032)

**A77-41570 # Hydrogen-via-Electricity - A candidate transitional transportation energy system concept.** E E Ecklund (ERDA, Washington, D.C.) and W J D Escher (ERDA, Washington, D.C., Escher Technology Associates, St. Johns, Mich.) In New options in energy technology, Proceedings of the Conference, San Francisco, Calif., August 2-4, 1977. New York: American Institute of Aeronautics and Astronautics, Inc., 1977, p. 140-149. 19 refs (AIAA 77-1034)

Available approaches to creation of a non-petroleum energy base for transportation all involve long-term, costly systems, each having technical and socio-economic limitations and constraints which will govern its eventual contribution. To preserve all options, yet take positive steps to obviate serious transportation energy shortfalls, transitional steps must be implemented beginning in the relatively near-term. The Hydrogen-via-Electricity (HVE) concept has been proposed as one candidate transitional system. This system utilizes the in-place electrical utility energy delivery systems to produce hydrogen energy via water electrolysis at selected vehicular fueling points. Vehicles converted to operate on hydrogen could be operated indirectly on coal and primarily on nuclear energy. The HVE concept has relatively near-term potential for supporting a certain fraction of such critical transportation modes as railroads, intercity trucking, buses and fleet vehicles of various kinds. Environmental benefits will also accrue. (Author)

**A77-41571 \* # The NASA Energy Conservation Program.** G P Gaffney (NASA, Office of Facilities, Washington, D.C.) AIAA, EEl, and IEEE, Conference on New Options in Energy Technology, San Francisco, Calif., Aug. 2-4, 1977, AIAA Paper 77-1005 3 p

Large energy-intensive research and test equipment at NASA installations is identified, and methods for reducing energy consumption outlined. However, some of the research facilities are involved in developing more efficient, fuel-conserving aircraft, and tradeoffs between immediate and long-term conservation may be necessary. Major programs for conservation include computer-based systems to automatically monitor and control utility consumption, a steam-producing solid waste incinerator, and a computer-based cost analysis technique to engineer more efficient heating and cooling of buildings. Alternate energy sources in operation or under evaluation include solar collectors, electric vehicles, and ultrasonically emulsified fuel to attain higher combustion efficiency. Management support, cooperative participation by employees, and effective reporting systems for conservation programs, are also discussed. J M B

**A77-41576 The atypical Mathew solar house at Coos Bay, Oregon.** J S Reynolds, M S Baker, R L Gray (Oregon, University, Eugene, Ore.), M B Larson (Oregon State University, Corvallis, Ore.), and H. Mathew (International Solar Energy Society, International Solar Energy Congress and Exposition, Los Angeles, Calif., July 28-Aug. 1, 1975) Solar Energy, vol 19, no 3, 1977, p. 219-232

The effectiveness of an atypical solar energy system in meeting space heating needs in the Mathew house in Coos Bay, Oregon is

analyzed in detail. Unusual features of this system include its location, which is cloudy in winter, its use of near-vertical collectors together with a near-horizontal reflector, its 8000 gal storage tank, its combination of a rooftop collector (400 sq ft) with a freestanding ground collector (325 sq ft) of almost identical design. The house heat loss is calculated and heat contributed by electricity, direct solar gain through windows, and metabolism is subtracted to obtain the assumed solar energy. The stored solar energy utilized is obtained by adjusting the measured energy provided by the collectors for energy withdrawn or contributed to storage during each month and for losses to ground. The space heating requirement for the house is calculated to be 14,802 kWh, of which 85% is provided by the solar energy system. Measured solar collector/storage tank contributions are in close agreement with those assumed from heat loss calculations over the 8-month heating season. Wide variations in some months can be partially accounted for by uncertainties in measurements and further indicate energy storage in the earth facing the reflector. C K D

**A77-41577 Use of adsorbent beds for energy storage in drying of heating systems.** D J Close (North Queensland, James Cook University, Townsville, Australia) and R V Dunkle (Commonwealth Scientific and Industrial Research Organization, Div. of Mechanical Engineering, Victoria, Australia) Solar Energy, vol 19, no 3, 1977, p. 233-238. 11 refs

Energy storage is an important feature of many solar energy systems. Because of the small temperature potentials available from flat plate collectors, large masses and volumes are involved when energy is stored by raising or lowering the temperature of a tank of fluid or bed of gravel. This paper proposes energy storage in the form of heat of adsorption in beds of adsorbent material. This is most readily achieved by nominating water as the adsorbate so that water vapour is transferred to or from the adsorbent from the humid air flowing through the bed. The large heat of adsorption means that the adsorption of a small mass of water liberates a large amount of energy which mostly is transferred to the air stream. It is shown that adsorbing materials can occupy a much smaller volume than non-adsorbing materials for the same quantity of energy stored, and that thermal insulation can be dispensed with. Provided that the container is impervious to water vapour, energy can be stored indefinitely. (Author)

**A77-41578 A solar flux density calculation for a solar tower concentrator using a two-dimensional Hermite function expansion.** M D Walzel, F W Lipps, and L L Vant-Hull (Houston, University, Houston, Tex.) (International Solar Energy Society, International Solar Energy Congress and Exposition, Los Angeles, Calif., July 28-Aug. 1, 1975) Solar Energy, vol 19, no 3, 1977, p. 239-253. 8 refs. NSF Grant No. GI-39456

The calculation of flux density on the central receiver due to a large number of flat polygonal reflectors having various orientations is a basic part of the system simulation problem for the tower concept of solar energy collection. A two-dimensional Hermite function expansion is adapted to the simulation problem, and numerical results are contrasted with an analytic integration of the solar flux density at specific nodes on an image plane. Various measures of error in the flux density calculation are monitored vs distance to the image plane and orientation of the reflector. The flux densities predicted by the statistical method compare favorably with those of the analytic model and require approximately one-tenth the computer time. (Author)

**A77-41579 Cost studies on terrestrial photovoltaic power systems with sunlight concentration.** D L Evans and L W Florschuetz (Arizona State University, Tempe, Ariz.) (International Solar Energy Society, International Solar Energy Congress and Exposition, Los Angeles, Calif., July 28-Aug. 1, 1975) Solar Energy, vol 19, no 3, 1977, p. 255-262. 6 refs. NSF Grant No. GI-41894, Contract No. E(11-1)-2590

A systems simulation program for comparing the energy costs associated with various alternative concentrating photovoltaic solar

systems to energy costs expected with flat arrays is described. The application to linear focus and point focus concentrators is presented in a parameterized way. The results show that concentration offers a distinct cost advantage at high cell costs. However, they also show that concentration has the potential for being a viable alternative to the flat unconcentrated arrays for cell costs as low as \$50/sq m. Also, for a given concentrator cost, cell cost and cell cooling effectiveness, there exists an optimum effective aperture area to cell area ratio. For reasonable projected cell costs, this optimum ratio is below 30 for passively cooled devices and below 60 for actively cooled systems.

**A77-41580** The effect of design and operating parameters on the performance of flat plate solar collectors - Calculation method and detailed appraisal. T. P. Woodman (Eidgenössische Technische Hochschule, Zurich, Switzerland). *Solar Energy*, vol 19, no 3, 1977, p 263-270. 5 refs.

This paper provides the engineer with the basic equations for calculating collector performance as a function of design and operating parameters and indicates the method of solution using a programmable desk calculator. The method is used to investigate the sensitivity of collector output to ambient air temperature, absorber plate temperature and emissivity, wind speed, atmospheric IR radiation and the number of cover plates. An analysis of losses from the absorber plate shows that reduction of radiation losses through reduced emissivity results in an absolute increase in convection losses, so that in the absence of measures to suppress convection, the attainment of emissivities below about 0.3 is hardly worthwhile. On the other hand, the use of two cover plates instead of one is shown to be nearly always beneficial. Analysis of losses from the outer cover plate shows that changes of the air temperature have a marked effect on the relative importance of radiation and convection as loss mechanisms. Problems connected with the use of the temperature difference between absorber and ambient air as a parameter are also discussed.

**A77-41581** Ellipsometry in the study of selective radiation-absorbing surfaces. E. M. Lushiku and K. R. O'Shea (Dar es Salaam, University, Dar es Salaam, Tanzania). *Solar Energy*, vol 19, no 3, 1977, p 271-276. 14 refs.

Ellipsometry is an inexpensive technique whereby the optical properties of surfaces are investigated by analyzing the polarization of reflected light. The experimental system consists of a source of monochromatic light of known wavelength, a suitable quarter wave plate, and two polaroids, mounted on rotatable discs with circular vernier scales for measuring the orientation of the transmission axes with respect to the plane of incidence. The system provides sensitive measurements of both optical constants and coating thicknesses, which are then used to compute the reflectivity of the surface at different wavelengths. The method was applied to single and double black nickel layers electro-deposited on polished copper substrates using the Silo and Mladinik (1969) electrolyte (nickel ammonia sulfate, zinc sulfate, potassium thiocyanide). Results are in good agreement with previously reported data.

**A77-41582** Simulation analysis of passive solar heated buildings - Preliminary results. J. D. Balcomb, J. C. Hedstrom, and R. D. McFarland (California, University, Los Alamos, N. Mex.). *Solar Energy*, vol 19, no 3, 1977, p 277-282. 6 refs. ERDA-sponsored research.

Solar gains through windows, walls, modified walls, skylights, clerestory windows, and roof sections provide an opportunity to dramatically reduce the total heating energy requirements of a building. Many such passive solar heating elements are currently available to a designer presenting a large number of possible system designs. A computer simulation analysis has been employed to aid in the selection of components. The results indicate that a performance comparable to that of a conventional active solar heating system should be achievable in an optimized design passive solar heating system. The placement and type of thermal storage is crucial to good performance. Movable insulation of the window increases the

performance. When used in conjunction with a conventional heating system, temperature variations in the building can be reduced to those normally experienced.

**A77-41583** The power conversion efficiency of the gold-Rhodamine B-gold photoelectrochemical cell. T. I. Quickenden and G. K. Yim (Western Australia, University, Nedlands, Australia). *Solar Energy*, vol 19, no 3, 1977, p 283-289. 40 refs.

The power conversion efficiency of the photoelectrochemical cell Au-Rhodamine B-Au was found to be about 2.4 millionths per cent under typical operating conditions. A ten-fold improvement could be expected from constructional modifications, but further increases in efficiency would require changes in the cell chemistry. The low power conversion efficiency can be related to a low (0.47 per cent) efficiency for the production of the open circuit photovoltage, a low (0.22 per cent) quantum efficiency for the production of the short circuit current, and to markedly non-rectangular voltage-current characteristics. The deviations from a rectangular relationship and the low efficiency of current production arise from mass-transport limitations rather than from ohmic losses or activation polarisation. The low voltage efficiency probably arises from inefficiencies in the photochemical and electron transfer steps which lead to photovoltage production. The limitations of this type of cell as a solar energy conversion device are discussed.

**A77-41584 \*** A comparison of GaAs and Si hybrid solar power systems. J. H. Heinbockel and A. S. Roberts, Jr. (Old Dominion University, Norfolk, Va.). *Solar Energy*, vol 19, no 3, 1977, p 291-300. 35 refs. Contract No. NAS1-11707-86.

Five different hybrid solar power systems using silicon solar cells to produce thermal and electric power are modeled and compared with a hybrid system using a GaAs cell. Among the indices determined are capital cost per unit electric power plus mechanical power, annual cost per unit electric energy, and annual cost per unit electric plus mechanical work. Current costs are taken to be \$35,000/sq m for GaAs cells with an efficiency of 15% and \$1000/sq m for Si cells with an efficiency of 10%. It is shown that hybrid systems can be competitive with existing methods of practical energy conversion. Limiting values for annual costs of Si and GaAs cells are calculated to be 10.3 cents/kWh and 6.8 cents/kWh, respectively. Results for both systems indicate that for a given flow rate there is an optimal operating condition for minimum cost photovoltaic output. For Si cell costs of \$50/sq m optimal performance can be achieved at concentrations of about 10, for GaAs cells costing 1000/sq m, optimal performance can be obtained at concentrations of around 100. High concentration hybrid systems offer a distinct cost advantage over flat systems.

**A77-41585** A new Chrome Black selective absorbing surface. P. M. Driver, R. W. Jones, C. L. Riddiford, and R. J. Simpson (New South Wales Institute of Technology, Broadway, Australia). *Solar Energy*, vol 19, no 3, 1977, p 301-306. 8 refs.

The quest for more efficient solar absorbers has resulted in the development of numerous coating techniques for the absorption panel itself. The Chrome-Black coating is an electroplated black-chrome coating on a copper substrate which combines the properties of high visible absorption, low infrared emission and excellent temperature stability in both air and vacuum environments. Results obtained show that surfaces may be produced both with high visible absorption to infrared emission ratios and with high absorption. Results were obtained assuming an air-mass 2 spectral distribution and a 50 deg C black body weighting for absorption and emission, respectively. All samples are known to be stable to at least 300 deg C. This type of coating would be expected to have good anti-corrosion properties and this has been confirmed by electro-chemical oxidation and reduction testing. A comparison is made between the topography of this coating and of sputtered metal surfaces.

**A77-41587** Simulation study of several solar heating systems with offpeak auxiliary. P. J. Hughes, J. A. Duffie, and W. A. Beckman (Wisconsin, University, Madison, Wis.). *Solar Energy*, vol 19, no 3, 1977, p 317-319. 9 refs. Contract No. E(11-1)-2588.

Simulation models were used to evaluate and compare the performance of two offpeak auxiliary solar air heating systems, one with combined and one with separate storage of solar and auxiliary energy. Both systems were modeled with a flat plate collector and an evacuated cylindrical glass tube collector. Separate storage was shown to be superior to combined storage regardless of collector type, although the difference is relatively small in the case of evacuated tube collectors. The performance of systems with combined storage becomes less sensitive to storage size as the collector loss coefficient decreases. The minimum temperature of the combined storage system need not be varied month to month if a 2.4% performance penalty is acceptable. C K D

**A77-41638 Photovoltaics - The semiconductor revolution comes to solar.** A. L. Hammond. *Science*, vol 197, July 29, 1977, p 445-447.

Options in photovoltaic technology currently under investigation or development are described. Advances in both flat-plate and concentrating systems are discussed. Among the design breakthroughs outlined for concentrating systems are multiple-junction cells, for which theoretical efficiencies approach 40%, and thermovoltaic systems, in which light which passes through a photovoltaic cell is absorbed and reradiated at lower wavelengths to the cell by a refractory material. Current developments in crystal growth methods and progress towards automation of assembly processes are considered. C K D

**A77-41645 Nuclear fusion - Focus on Tokamak.** D. Steiner (Oak Ridge National Laboratory, Oak Ridge, Tenn.) *IEEE Spectrum*, vol 14, July 1977, p 32-38.

An overview of nuclear fusion engineering is presented covering basic fusion technology, magnetic and inertial confinement schemes, fusion fuel, tritium breeding, blankets, tritium containment and disposal, fusion process waste management, power generation costs, environmental impact, and safety. Attention is focused on closed magnetic confinement systems, specifically Tokamak systems. The outlook for pulsed/batch or continuous Tokamak operation is assessed. Power supplies for driving plasma current and for neutral-beam injectors, the radioactivity (intensity and decay times) of fusion reactor wastes, and anticipated costs of fusion-generated power and fusion reactor safety engineering are dealt with. Applications of fusion reactors other than electric power generation are discussed (hybrid fission-fusion systems, breeding fissionable material and burning high-level wastes, synthetic fuel production, radiation processing). R.D.V.

**A77-41649 Energy from bioconversion of waste materials.** D. J. De Renzo. Park Ridge, N.J., Noyes Data Corp. (Energy Technology Review, No. 11, Pollution Technology Review, No. 33), 1977. 236 p. 177 refs. \$32.

The production of gas by bioconversion of solid wastes is discussed. The amount of organic matter potentially available from a variety of sources, including urban wastes, agricultural by-products, animal wastes, industrial wastes, and biomass crops grown specifically for bioconversion is estimated. Anaerobic decomposition processes are outlined, and controlling factors in methane fermentation are considered. The results obtained in a wide range of studies involving systems for urban trash methanation, bioconversion of solid waste and sewage sludge, methane production from energy crops, and animal waste digestion are presented. C K D

**A77-41683 Minor radius compression experiments.** D. C. Robinson (EURATOM and U.K. Atomic Energy Authority Fusion Association, Culham Laboratory, Abingdon, Oxon, England). In: Symposium on Plasma Heating in Toroidal Devices, 3rd, Varenna, Italy, September 6-17, 1976, Lectures and Contributed Papers. Bologna, Editrice Compositori, 1976, p. 168-172. 16 refs.

Adiabatic compression in the minor radius as used by the TUMAN and TOSCA Tokamaks is described. Adiabatic compression

is used to supplement ohmic heating, which by itself is insufficient to produce ignition (other than possibly at low densities). Scaling, equilibrium, and stability of a minor and minor-major radius compression are discussed. Results are presented for both TOSCA and TUMAN. Procedures are suggested for organizing experiments with TOSCA for the purpose of improving the overall efficiency of ohmic heating. M L

**A77-41698 Neutral injection at PPPL, past and present.** R. R. Smith (Princeton University, Princeton, N.J.). In: Symposium on Plasma Heating in Toroidal Devices, 3rd, Varenna, Italy, September 6-17, 1976, Lectures and Contributed Papers. Bologna, Editrice Compositori, 1976, p. 254-258. 14 refs. Contract No. E(11-1) 3073.

Physical parameters are compared for the injection of energetic atoms into plasmas produced by the Adiabatic Toroidal Compressor (ATC) and by the Princeton Large Torus (PLT). The ion temperature increase in the ATC remained nearly linear at 1 eV per KW up to 230 KW. The results are compared with the predictions of a simulation code, and this model's predictions for the PLT and the Princeton Diverto Experiment are presented. M L

**A77-41706 Heating of the Frascati Tokamak by means of quasi-perpendicular neutral injection.** M. Haegi (EURATOM and Comitato Nazionale per l'Energia Nucleare sulla Fusione, Centro Gas Ionizzati, Frascati, Italy) and E. Bittoni (Comitato Nazionale per l'Energia Nucleare, Centro di Calcolo, Bologna, Italy). In: Symposium on Plasma Heating in Toroidal Devices, 3rd, Varenna, Italy, September 6-17, 1976, Lectures and Contributed Papers. Bologna, Editrice Compositori, 1976, p. 293-295. 6 refs.

**A77-41710 Additional heating and refuelling for the ASDEX divertor Tokamak.** G. Haas, M. Keilhacker, A. Stabler (Max-Planck-Institut für Plasmaphysik GmbH, Garching, West Germany), W. Henkes, and R. Klingelhofer (Max-Planck-Institut für Plasmaphysik GmbH, Garching, Karlsruhe, Kernforschungszentrum, Karlsruhe, West Germany). In: Symposium on Plasma Heating in Toroidal Devices, 3rd, Varenna, Italy, September 6-17, 1976, Lectures and Contributed Papers. Bologna, Editrice Compositori, 1976, p. 308-317. 28 refs. EURATOM-sponsored research.

**A77-41712 Plasma heating systems planned for the Argonne experimental power reactor.** P. Bertoini, J. Brooks, J. Fasolo, F. Mills, A. Moretti, and J. Norem (Argonne National Laboratory, Argonne, Ill.). In: Symposium on Plasma Heating in Toroidal Devices, 3rd, Varenna, Italy, September 6-17, 1976, Lectures and Contributed Papers. Bologna, Editrice Compositori, 1976, p. 326-332. ERDA-sponsored research.

**A77-41718 Additional heating in JET.** J. Sheffield (EURATOM and U.K. Atomic Energy Authority, Culham Laboratory, Abingdon, Oxon, England). In: Symposium on Plasma Heating in Toroidal Devices, 3rd, Varenna, Italy, September 6-17, 1976, Lectures and Contributed Papers. Bologna, Editrice Compositori, 1976, p. 362-364. 16 refs. Contract No. EURATOM-30-74-IFUA-C.

The objectives of JET are summarized and the heating power required to achieve them is determined. It is shown that Ohmic heating, which is the main source of energy in present Tokamaks, will not be adequate in JET unless either the energy confinement time is very favorable or there is a large resistance anomaly. It is proposed to bridge the gap between the required power and Ohmic power with neutral injection, radio frequency heating and adiabatic compression. The application of these techniques to JET is discussed. (Author)

**A77-41722 Study of the feasibility of exploiting the galloping phenomenon as energy source.** (Etude de la possibilité de l'emploi du phénomène du galop comme source d'énergie). A.

Laneville (Sherbrooke, Université, Sherbrooke, Quebec, Canada) *Canadian Society for Mechanical Engineering, Transactions*, vol 4, no 1, 1976-1977, p 23-26 7 refs In French

Aeroelastic galloping, or vibrations of an aerodynamically unstable prism, is explored as a potentially useful conversion mechanism for exploiting wind energy. Vibrations associated with shedding of vortices are assumed present. The shed vortices generate oscillations of the galloping prism only when the Strouhal frequency corresponds to the prism natural frequency (at a single wind velocity). The efficiency of the mechanism is found questionable for the application in mind. The orientation of the prism in a wind field constantly changing in direction, turbulence spectra, and conversion of the constant frequency generated to 60 Hz by an appropriate set of masses and springs, are considered. R D V

**A77-41741 High-efficiency GaAlAs/GaAs heterostructure solar cells grown by metalorganic chemical vapor deposition.** R D Dupuis, P. D. Dapkus, R. D. Yingling, and L. A. Moudy (Rockwell Electronics Research Center, Anaheim, Calif.) *Applied Physics Letters*, vol 31, Aug 1, 1977, p. 201-203, 14 refs Contract No. E(04-3)-1202.

High-efficiency GaAlAs/GaAs heterostructure solar cells have been grown by metalorganic chemical-vapor deposition (MO-CVD). Simulated air-mass-zero (AM0) short-circuit current densities of 24.5 mA/sq cm, open-circuit voltages of 0.99 V, fill factors of 0.74, and efficiencies of 12.8% have been measured on devices without AR coatings (uncorrected for contact area). These cell structures employ a thin (about 520 Å) GaAlAs Zn window and a GaAs Zn/GaAs.Se p-n junction grown entirely by the MO-CVD process. (Author)

**A77-41800 The flow of heat from the earth's interior.** H N Pollack (Michigan, University, Ann Arbor, Mich.) and D S Chapman (Utah, University, Salt Lake City, Utah). *Scientific American*, vol 237, Aug 1977, p 60-68, 73-76

The major findings highlighted in a survey of the relationship between plate tectonics and heat flow from the earth's interior are: (1) heat flow decreases with increasing age of the geological province in question, (2) a definite relationship obtains between surface heat flow and the radioactivity of surface rocks over large continental areas. Problems in mapping heat flow on a global basis, and specifically at continental and oceanic surfaces, are reviewed. Two components to heat flow are noted: a crustal component and a deeper component originating in the mantle. A world map of geothermal heat flow measurements is displayed. Sea-floor spreading, subduction zones and heat-flow patterns at such zones, and the contribution of surface radioactivity to surface heat flow (40%), are discussed at length. R D V.

**A77-41822 The unitary heat pump industry - 25 years of progress.** J A Pietsch (General Electric Co., Air Conditioning Business Div., Tyler, Tex.) (Illinois Institute of Technology, American Power Conference, Chicago, Ill., Apr 18-20, 1977) *ASHRAE Journal*, vol 19, July 1977, p 15-18

The history of heat pump development in the U.S. is reviewed, and the relative attractiveness of electric furnaces, heat pumps, and solar heating systems is discussed. Commercial distribution of heat pump units, which was initiated in the early 1950s, suffered declines in the 1960s due to a record of poor reliability, but registered rapid growth after 1970, when higher electricity costs made electric furnaces less competitive, and improved quality control increased the attractiveness of heat pumps. Heat pumps, involving higher initial costs than electric furnaces, are attractive as long as their efficiency (200% or more) provides an eventual return on the investment. Solar heating systems, with high seasonal efficiencies (400 to 600%), nevertheless may not be attractive investments if initial costs are very high. In developing new heat pump designs, tradeoffs between increased efficiency and higher initial cost need to be made. J M B

**A77-41823 The annual cycle energy system - A hybrid heat pump cycle.** R A Biehl (Robert G. Werden Associates, Inc., Jenkintown, Pa.) *ASHRAE Journal*, vol 19, July 1977, p 20-24

A year-round heating and cooling system based on a heat pump is described. In cool weather down to a temperature of 4°C the system functions as an air-source heat pump, while at lower temperatures it becomes a water-source heat pump employing the latent heat of fusion given up by water in its change of phase to ice. Furthermore, in warm weather the system provides cooling from a bank of stored ice. Various modes of operation, which may involve combinations of the system's collector/radiator capabilities, defrosting mechanisms, and the cooling capacity of the ice storage tank, are discussed, a microprocessor which accumulates data from ambient and interior sensors determines the most appropriate mode for given circumstances. Details of construction for the ice storage tank are also given. Advantages of the system include: it annually consumes 40% less energy than a conventional system, the payback period, now about 11 years, could be reduced to a commercially acceptable level of 6 to 8 years by advances in the design of the ice storage tank. J M B

**A77-41824 10 design principles for air-to-air heat pumps.** A Trask. *ASHRAE Journal*, vol 19, July 1977, p 30-33

Alterations in the design of air-to-air heat pumps are suggested with the aim of increasing the efficiency of the device and reducing mechanical failure in the compressors, the chief source of unreliability in the air-to-air heat pumps. Stresses encountered by the compressors during the defrost cycle may be decreased by introduction of an evaporator pressure-regulating valve, or constant pressure (CP) valve, to take the place of the accumulator presently used. Like the accumulator, the CP valve would prevent liquid floodback into the compressor at the beginning of heating cycles. Furthermore, it would circumvent problems caused by evacuation of the crankcase and outdoor coil during the defrost cycle, assure constant lubrication of the compressor, lead to a shorter defrost cycle, and permit defrosting down to an outdoor temperature of -20°F. By maximizing use of available heat and eliminating the accumulator and other mechanisms, the modified air-to-air heat pump would increase both its effectiveness and reliability at relatively low cost. J M B

**A77-41851 Solar ponds - Low cost solar energy management systems.** L H Shaffer. *Energy*, vol 2, Summer 1977, p 18-20

The large areas required to obtain significant amounts of heat or work from solar energy lead to high collector costs. A five- to tenfold reduction in manufacturing costs of photovoltaic silicon devices would bring the cost of DC energy without storage to \$500/peak KW, assuming an efficiency of 10%, flat collectors for solar-based heat cost \$20-30/sq ft. Solar ponds represent an approach which combines long term storage with low cost \$4 to \$10/sq ft. Three types of solar ponds - the salt stabilized solar pond, the shallow solar pond developed at the Lawrence Livermore Laboratory, and the viscosity stabilized pond - are discussed. The costs of each type of system are estimated. Difficulties which may be encountered in the construction and operation of solar ponds are considered. C K D

**A77-41852 Energy conservation by symbiosis.** E V Sherry (Air Products and Chemicals, Inc., Allentown, Pa.) *Energy*, vol 2, Summer 1977, p 21-23 9 refs

Methods whereby utilities and industries can cooperate to conserve energy, optimize investments, and produce goods and useful energy less expensively are discussed. A prime example of such cooperation is co-generation, where the use of fuels is optimized by generating steam for industry or district heating while producing electricity for the public. Other schemes involve recovery of energy and refrigeration stored in the latent heat and low temperature of liquefied natural gas, oxygen enrichment of utility combustion air, and joint use of synthetic natural gas plants to produce chemicals in addition to synthetic fuel. Factors responsible for the relatively slow development of 'symbiotic' relationships between industry and utilities are considered. Projects in the United States and Europe involving industry-utility cooperation are described. C K D

**A77-41855 # The roles of aerospace organizations in energy development or can aerospace success bring success in energy.** H B.

Finger (GE Center for Energy Systems, Washington, D.C.). *AIAA, EEl, and IEEE, Conference on New Options in Energy Technology, San Francisco, Calif., Aug. 2-4, 1977, AIAA Paper 77-1001*. 5 p.

To cope with energy shortages, the U.S. needs to reduce its reliance on imported oil, emphasize fuel conservation programs, increase its use of coal and fissionable fuel, and support research and development of alternate energy systems. The aerospace industry has already undertaken research into solar electric power generation, wind-generated power systems, and microwave transmission of space solar energy. Solar heating and cooling, fuel cells, and centrifuge technology for uranium enrichment seem economically viable systems, but their cost and performance competitiveness will be determined in the marketplace. Suggestions for improving the rate of development of viable alternate systems include collaboration between the aerospace industry and businesses having expertise in marketing, the organization of large-scale testing facilities, and government aid when high-risk development programs are involved. J.M.B.

**A77-41856 # Solar energy - Promises and pitfalls.** R. B. Peterson (Grumman Energy Systems) *AIAA, EEl, and IEEE, Conference on New Options in Energy Technology, San Francisco, Calif., Aug. 2-4, 1977, AIAA Paper 77-1022*. 15 p. 13 refs.

Although solar energy systems cannot be justified economically as providers of 100% of a home's heating requirements, combinations of solar heating and conventional utilities for space and hot water heating are feasible. Studies by Mitre-ERDA and the Office of Technology Assessment indicate that in most parts of the U.S. solar heating is now competitive with electricity, in many areas, tax incentives may make it competitive with oil and gas systems as well. However, there is need for government rating of the efficiency and durability of solar energy collectors and rating of the BTU output of solar energy systems, so that consumers may better judge their efficacy. A demonstration home equipped with heavy insulation and a solar energy system was found capable of obtaining 40-50% of its space heating needs from solar heating, as opposed to 20% without the insulation. Thus, good insulation practices and elimination of tax penalties for solar heating installations will increase their viability as economical systems. J.M.B.

**A77-41865 # Optimum concentration ratio for a solar central-receiver electric power plant.** J. W. Baughn (California, University, Davis, Calif.) and J. B. Bergquam (California State University, Sacramento, Calif.) *ASME, Transactions, Series A - Journal of Engineering for Power*, vol. 99, July 1977, p. 490, 491. 8 refs.

**A77-41902 Investigation of energy parameters of low-temperature ring thermopiles.** M. A. Markman, L. M. Simanovskii, and I. R. Iurkevich (Vsesoiuznyi Nauchno-Issledovatel'skii Institut Istochnikov Toka, Moscow, USSR) (*Geliotekhnika*, no. 6, 1976, p. 11-13) *Applied Solar Energy*, vol. 12, no. 6, 1976, p. 7, 8. Translation.

The energy parameters of annular low-temperature thermal batteries for clamped tubular modules were investigated. The average values of thermal battery parameters were measured in the whole operating temperature range. A comparison was made of the efficiency of thermal batteries, in which thermoelectric materials of various types were used, as a function of the temperature range of their application. P.T.H.

**A77-41905 Method for calculating the profiles of foci and focal lines.** V. K. Baranov (*Geliotekhnika*, no. 6, 1976, p. 24-28) *Applied Solar Energy*, vol. 12, no. 6, 1976, p. 17-19. Translation.

Techniques are described for rapid and practically exact construction of profiles of parabolo-toroidal focusing concentrators and parabolo-cylindrical focusing wedges. Values of the radius vectors needed for constructing the profile of the parabola are tabulated. An example of the design of a profile of a focusing concentrator and a focusing wedge with parametric angle of 20 deg is given. P.T.H.

**A77-41906 Experimental setup for measuring space and energy characteristics of solar concentrators.** B. A. Bazarov and V. M. Kapeliushnikov (Akademiia Nauk Turkmensoi SSR, Fiziko-Tekhnicheskii Institut Ashkhabad Turkmen SSR) (*Geliotekhnika*, no. 6, 1976, p. 29-34) *Applied Solar Energy*, vol. 12, no. 6, 1976, p. 20-23. 5 refs. Translation.

**A77-41907 Concentrating capability of spherical facets.** R. A. Zakhidov (Akademiia Nauk Uzbeksoi SSR, Tsentral'noe Proektno-Konstruktorskoe i Tekhnologicheskoe Biuro Nauchnogo Priborostroeniia, Uzbek SSR) and A. Sh. Khodzhaev (Akademiia Nauk Uzbeksoi SSR, Fiziko-Tekhnicheskii Institut, Tashkent, Uzbek SSR) (*Geliotekhnika*, no. 6, 1976, p. 35-37) *Applied Solar Energy*, vol. 12, no. 6, 1976, p. 24, 25. Translation.

Formulas are derived for calculating irradiance in the radiation field of a spherical facet. It is shown that the concentrating power of spherical and parabolic facets are identical. P.T.H.

**A77-41909 Composite concentrators with spherical radiation sources.** L. Ia. Paderin (Tsentral'nyi Aerogidrodinamicheskii Institut, Moscow, USSR) (*Geliotekhnika*, no. 6, 1976, p. 43-51) *Applied Solar Energy*, vol. 12, no. 6, 1976, p. 30-36. Translation.

The paper describes a method for calculating the distribution of luminous fluxes from spherical sources of radiation on irradiated surfaces of composite concentrators. These concentrators consist of sets of conical or spherical rings of equal width which intersect at their initial and terminal sections ellipsoids of revolution. The distribution of luminous fluxes in the focal plane of the generator of the ellipsoidal surface is then calculated. The results enable making a choice of optimal parameters of composite concentrators. P.T.H.

**A77-41910 Fundamentals of solar-energy survey development.** R. B. Salieva (Tashkentskii Elektrotekhnicheskii Institut Sviazi, Tashkent, Uzbek SSR) (*Geliotekhnika*, no. 6, 1976, p. 61-77) *Applied Solar Energy*, vol. 12, no. 6, 1976, p. 45-57. 12 refs. Translation.

The paper examines some of the principles of developing a solar energy inventory on the basis of a mathematical model, by the parameters of which it would be possible to determine the productivity of a solar energy facility of any design and establish its effectiveness and suitability for various types of landscapes. The mathematical model is considered from unified viewpoints of stochastic process theory. Modeling algorithms are given and results of computer calculations are given in tables, from which one can deduce the productivity and utilization factor of the rated power of facilities of arbitrary design. P.T.H.

**A77-41933 # Have energy, will travel.** J. E. Allen (Hawker Siddeley Aviation, Ltd., Kingston-on-Thames, Surrey, England). In: The place of aviation in society, Proceedings of the Fifteenth Anglo-American Aeronautical Conference, London, England, May 31-June 2, 1977. London, Royal Aeronautical Society, 1977. 30 p. 37 refs.

An investigation is conducted concerning the possibilities to obtain the energy needed for aviation in the future, in the face of the progressing depletion of petroleum resources. The approaches considered include a diversion of oil for premium transport use, the development of low fuel-use aircraft, an employment of kerosene synthesized from coal or shale, and a worldwide introduction of liquid hydrogen for aircraft. Attention is also given to the prospects of lighter-than-air vehicles, fusion power, solar energy systems, and the production of alternative liquid hydrocarbons from vegetables, wood, and municipal waste. G.R.

**A77-41939 # Competitive restraints on air travel - Ground modes and telecommunications.** R. S. Shevell (Stanford University, Stanford, Calif.). In: The place of aviation in society, Proceedings of the Fifteenth Anglo-American Aeronautical Conference, London, England, May 31-June 2, 1977. London, Royal Aeronautical Society, 1977. 16 p. 7 refs.

The reported investigation shows that advanced ground modes will compete successfully with air transportation at short ranges on

high density routes Improved trains are the most likely form for future short range public ground transportation The high initial guideway cost will limit track levitated vehicles to a few very high density routes, if indeed it exists at all As distances increase beyond the range from 300 to 500 kilometers, the air mode becomes increasingly preferable both in speed and cost Except for the minimum cost mode, the bus, aircraft will provide public transportation at ranges beyond 800 kilometers G R

**A77-41943 # North American freight transportation - Near or incipient chaos.** H V Braceland (Air Canada, Montreal, Canada). In The place of aviation in society, Proceedings of the Fifteenth Anglo-American Aeronautical Conference, London, England, May 31-June 2, 1977 London, Royal Aeronautical Society, 1977. 17 p

The existing freight transport system in North America is discussed Shipping patterns for all modes of transportation are outlined Advantages and disadvantages of different modes of freight transport are considered in the light of present requirements, and their ability to adapt to future requirements imposed by environmental factors, fuel shortages, and volume growth is assessed Specific goals for modernization and coordination of the freight transport system as a whole are suggested Problem areas are pinpointed

**A77-41969 # Advanced supersonic transport propulsion requirements** R W Hines (United Technologies Corp, Pratt and Whitney Aircraft Group, East Hartford, Conn ) *American Institute of Aeronautics and Astronautics and Society of Automotive Engineers, Propulsion Conference, 13th, Orlando, Fla, July 11-13, 1977, AIAA Paper 77-831* 7 p 8 refs

One of the most promising propulsion systems (The Variable Stream Control Engine) for supersonic commercial transport application is reviewed The benefits of advanced propulsion technology, as applied to the Variable Stream Control Engine, are presented on an overall systems basis showing the full impact on a supersonic transport airplane from an environmental, performance, and economic viewpoint The advanced propulsion program, required for the United States to maintain a competitive position in the future commercial airplane market, is also presented (Author)

**A77-42038 The impact of the energy crisis on the demand for fuel efficiency - The case of general aviation.** R B Archibald and W S Reece (U S Department of Labor, Bureau of Labor Statistics, Washington, D C ) *Transportation Research*, vol 11, June 1977, p 161-165 17 refs

One of the most important questions accompanying the debate over energy policy is whether or not consumers will react to increased fuel prices by choosing more fuel efficient transportation modes This paper addresses this question by developing a theoretical rationale for the hypothesis that the energy crisis has induced an increase in the demand for fuel efficiency as a characteristic of aircraft and empirically tests this hypothesis with data from the U S general aviation market (Author)

**A77-42071 Wind structure in strong winds below 150 m.** H A Panofsky (Pennsylvania State University, University Park, Pa ) *Wind Engineering*, vol 1, no 2, 1977, p 91-103 20 refs

Wind data are separated into mean wind data and wind fluctuations data for wind engineering purposes The distribution of mean wind over homogeneous terrain in strong winds, the effect of stability on wind profiles, the effect of terrain change on wind speed, variability of wind velocity (direction and magnitude), and the spectra and cross spectra of wind speed are discussed in separate sections Cross spectra between wind speeds at various positions are broken down into cospectrum and quadrature spectrum Selection of an appropriate averaging interval for the study of wind fluctuations is discussed R D V

**A77-42072 A theory and experimental investigation of ducted wind turbines** R I Lewis, J E Williams, and M A Abdelghaffar (Newcastle-upon-Tyne, University, Newcastle-upon-Tyne, England). *Wind Engineering*, vol 1, no 2, 1977, p. 104-125.

Practical wind turbine designs are examined and compared, with the object of selecting the one best suited to domestic use in low-level technology. Attention is focused in this paper on ducted (open) wind turbines Wind turbine (WT) ideal efficiency (ducted or unshrouded), total wind thrust on the system, design of a theoretical WT duct, diffuse design, and turbine design (blading and impeller) are described Experiments conducted on small and large ducts are described Results show that a gain in power output can be obtained from a WT of specified diameter by using a suitably shaped duct The optimum diffuser area ratio is found to be roughly 10% larger than the theoretically predicted value. Power output is maximized when some stall exists at the diffuser outlet R D V

**A77-42073 Effects of wind fluctuations on windmill behaviour** W J G J der Kinderen, J J. E. A. van Meel, and P T Smulders (Eindhoven, Technische Hogeschool, Eindhoven, Netherlands) *Wind Engineering*, vol 1, no 2, 1977, p 126-140 8 refs

A system-analytical approach is proposed to describe the output, i.e., power and forces, of a wind machine for the stochastic input signal, the wind A simple model is presented to describe the fluctuations of wind speed and direction by means of average wind speed and wind direction, their variances and time constants These input signals are used to calculate the influence of wind fluctuations on windmill performance, including the effects of nonuniformity of the flow in the rotor plane, rotor inertia and yawing of the rotor heat. Experimental results for a small 2-bladed windgenerator (diameter about 4 m) are reported. (Author)

**A77-42074 Variable speed wind turbines for high wind energy conversions** A Kling (Luftfahrzeug System, Berg, West Germany). *Wind Engineering*, vol. 1, no. 2, 1977, p. 141-149. 7 refs.

This study compares variable speed and constant speed rotor generator systems, and shows that under certain conditions the former may extract more than twice as much useful energy as the latter. Also suggested are a rotor configuration having less vibrational problems than the propeller and a high frequency generator specially adaptable to variable speed systems. (Author)

**A77-42075 The 'wind-wall' - An integrated wind/solar system.** J C. McVeigh (Brighton Polytechnic, Brighton, Sussex, England) and G W. W. Pontin (Wind Energy Supply Co., Peacehaven, Sussex, England). *Wind Engineering*, vol 1, no 2, 1977, p 150-158 5 refs.

Design of an integrated system combining a windmill system and solar panels is discussed The system is intended for power supply to residential areas A bank of fixed ducted windmills and batteries of solar collectors sharing a common overall site are considered in an arrangement providing hot water and space heating A water reservoir heat storage system, basic electrical system, and the pattern of energy supply and demand are outlined R D V

**A77-42151 Cryogenic Engineering Conference, Queen's University, Kingston, Ontario, Canada, July 22-25, 1975, Proceedings** Conference supported by the Aerospace Corp, Japanese National Railways, National Bureau of Standards, et al Edited by K D Timmerhaus (Colorado, University, Boulder, Colo ) and D H Weitzel (National Bureau of Standards, Boulder, Colo ) New York,

Plenum Press (Advances in Cryogenic Engineering Volume 21), 1976 562 p \$42.50 (For individual items see A77-42152 to A77-42171)

Contributions to the 1975 Conference are grouped under the following main topics (1) superconducting magnets, (2) applied superconductivity systems design, (3) superconductive energy systems, (4) energy systems, (5) refrigeration, (6) instrumentation, (7) heat transfer and fluid dynamics, (8) liquefied natural gas technology, (9) safety, (10) cryo-bioengineering applications, (11) cryo-technology applications, (12) fluid properties. Among the specific topics discussed are magnets for levitation-aided transportation and for fusion reactors, superconductive energy transfer and storage, supercritical He refrigerators, cooling of long conduits, liquid He heat transfer, LNG storage tanks and carriers, cryogenic laser fusion targets, and reversible cryostorage of bio-materials. R D V

**A77-42156** Cryogenic design for large superconductive energy storage magnets. J A Hlal (Wisconsin, University, Madison, Wis.) and G E McIntosh. In Cryogenic Engineering Conference, Kingston, Ontario, Canada, July 22-25, 1975, Proceedings. New York, Plenum Press, 1976, p. 69-77. Research supported by the Wisconsin Alumni Research Foundation, Wisconsin Electric Utilities Research Foundation and NSF.

Close attention is accorded to selection of operating temperature and cooling method. A computer program optimizing the temperature of a finite number of refrigerated thermal radiation shields is worked out, and typical shield temperatures are presented in tabular form. Pool boiling in normal He, forced convection with normal He, and superfluid He cooling are discussed. Minimization of thermal radiation heat leak to the energy storage magnet (by using cooled shields, superinsulation, or floating shields) is considered. Realizability of a completely stable magnet via pool cooling in superfluid He is indicated. R D V

**A77-42160** Temperature excursions during loss of magnet coolant accidents with thermalization of energy of large superconducting solenoids. R C Amar, T H K Frederking, and W E Kästner (California, University, Los Angeles, Calif.). In Cryogenic Engineering Conference, Kingston, Ontario, Canada, July 22-25, 1975, Proceedings. New York, Plenum Press, 1976, p. 109-114. 16 refs. Research supported by the Electric Power Research Institute.

**A77-42161** Applications of superconducting magnets to energy with particular emphasis on fusion power. P Komarek (Karlsruhe, Universität, Karlsruhe, Kernforschungszentrum, Karlsruhe, West Germany). In Cryogenic Engineering Conference, Kingston, Ontario, Canada, July 22-25, 1975, Proceedings. New York, Plenum Press, 1976, p. 115-139. 65 refs.

The feasibility of employing superconducting magnets for energy conversion and energy storage, in addition to the use of superconductivity in power transmission, is explored. Prospects for commercial use of superconducting homopolar machines and MHD generators appear optimistic. Problems to be solved in the use of superconducting synchronous machines include turboalternator design, heat transfer and helium flow in rotating channels, fatigue and structure at cryogenic temperatures, and long-life rotating helium seals and vacuum seals. Fusion power via magnetic confinement remains the principal prospect for utilization of superconductivity in energy. Inductive energy storage systems are examined and compared to flywheel systems. Reliability of superconducting windings and their structure remain serious problems. R D V

**A77-42164** Element rating and coupling harmonics in a superconductive energy transfer system. R S Ramshaw and E P Dick (Waterloo, University, Waterloo, Ontario, Canada). In Cryogenic Engineering Conference, Kingston, Ontario, Canada, July 22-25, 1975, Proceedings. New York, Plenum Press, 1976, p. 157-165. 5 refs.

An attempt is made to optimize system element rating, rather than system energy. An increase in transfer rate based on the use of nonsinusoidal coil coupling, with the zero-torque constraint main-

tained, is examined. System costs are optimized for rotor energy, system energy, or element energy. A modified coupling distribution arrived at enables a 30% decrease in theoretical transfer time. Inductance optimization is a crucial aspect of the approach. Mechanical torque measurement within the cryostat and the effect of ac superconductor losses on mechanical torque and load current are also discussed. R D V

**A77-42165** Economic aspects of U.S. energy independence in the coming decade. K D Timmerhaus (Colorado, University, Boulder, Colo.) and D H Weitzel (National Bureau of Standards, Boulder, Colo.). In Cryogenic Engineering Conference, Kingston, Ontario, Canada, July 22-25, 1975, Proceedings. New York, Plenum Press, 1976, p. 166-179. 42 refs.

Currently available energy sources are surveyed (petroleum, natural gas, coal, oil shale, nuclear power, imported and domestic supplies), and a projection is advanced for the potential production capacity needed as of 1985 for the U.S. to achieve energy independence. Capital investment requirements for reaching such a goal comprise the principal constraint examined in the survey. The cryogenic aspects of the problem are summarized as: liquefied natural gas, conversion of coal to fuel gas (using tonnage oxygen from air separation plants), superconductors in power plants and transmission lines, superconducting instruments for geophysical exploration, and the 'hydrogen economy'. R D V

**A77-42166** Cryogenic fuel systems for motor vehicles. J J Hibi (Beech Aircraft Corp., Boulder, Colo.). In Cryogenic Engineering Conference, Kingston, Ontario, Canada, July 22-25, 1975, Proceedings. New York, Plenum Press, 1976, p. 180-186. Discussion, p. 186. 9 refs.

The cryogenic fuels considered include liquid hydrogen, which is projected to be the fuel of the future, and liquid natural gas (LNG) for the near term. A design and development program for automotive LNG tanks is discussed. In LNG service, the automotive cryogenic tank prototype demonstrated a lockup time of nearly 14 days in laboratory tests. In conditions of actual field use, loss of fluid due to venting rarely occurred. On the basis of the program results, it is concluded that in areas where LNG is available in quantity LNG will continue to be an economical alternate fuel for fleet operators. Operation of a vehicle which was fueled with liquid hydrogen proved that safe and efficient operation is achievable. The preliminary system employed did not have the desired thermal or mechanical efficiency desired. However, it appears that the improvements needed are achievable without any major development efforts. G R

**A77-42254** Tropospheric oxidation of H<sub>2</sub>S. J L Sprung (California, University, Riverside, Calif.). In Advances in environmental science and technology. Volume 7. New York, Wiley-Interscience, 1977, p. 263-278. 54 refs. NSF Grant No. 75-15711.

In California, interest in H<sub>2</sub>S oxidation is stimulated by the possible development of geothermal resources, which could lead to the release of significant amounts of H<sub>2</sub>S into the troposphere. H<sub>2</sub>S is toxic, and the rate of its oxidation to SO<sub>2</sub> will affect the significance of H<sub>2</sub>S as an air pollutant. The tropospheric chemistry of H<sub>2</sub>S is surveyed, with attention to kinetic data useful for modeling atmospheric chemical reactions. Reactants, reactive intermediates, and homogeneous reactions are discussed in detail. M L

**A77-42259** # The possibility of using regression models for calculating the effect of weather conditions on electric energy demand (O vozmozhnosti primeneniya regressionnykh modelei dlia ucheta vlianiia pogodnykh uslovii na spros elektroenergiu). V. I. Shatalov and E. N. Kopach (Akademiia Nauk SSSR, Sibirskii Nauchno-Issledovatel'skii Institut Energetiki, Irkutsk, USSR). *Energetika*, vol. 20, May 1977, p. 36-40. 6 refs. In Russian.

**A77-42260** # An analytical study of the maximal heat-carrying capacity of heat pipes (Analiticheskoe issledovanie maksimal'noi teploperedavushchei sposobnosti teplovyykh trub). M. G. Semena, A. N. Gershuni, and B. M. Rassamakin (Kievskii Politekhnikheskii Institut, Kiev, Ukrainian SSR). *Energetika*, vol. 20, May 1977, p. 93-97. 10 refs. In Russian.

An analytical solution is obtained for determining the hydrodynamic limit of the heat-carrying capacity of a cylindrical heat pipe with an annular isotropic wick. The differential equation of fluid movement in the wick of the heat tube is solved by the separation of variables method using an orthogonalized basis. Experiments were conducted using water heat pipes with metal fiber wicks. The theoretical calculations were in basic agreement with the experimental results. M L

**A77-42262 #** Methodological questions concerning the evaluation of the economic potential of energy resources (Metodicheskie voprosy otsenki ekonomicheskogo potentsiala energeticheskikh resursov) A A Semenov (Severo-Zapadnyi Zaochnyi Politehnicheskii Institut, Leningrad, USSR) *Energetika*, vol 20, May 1977, p 112-116 5 refs In Russian

It is suggested that the economic significance of different forms of fuel resources are determined by trends in their national economic use. Resource supplies can be appraised in terms of their economic value. The calculation of value is achieved by forming a closed statistical system. Criteria are given for the economic potential of water resources. M L

**A77-42401 #** The oceans as a source of electricity D J Littler (Central Electricity Generating Board, London, England) *Aware*, July 1977, p 12-15

Several methods for extracting energy from the ocean are described. Floating installations to harness wave power include a cam-shaped rocking float that minimizes both reflection and transmission of energy, coupled rafts, the variations in whose surface profiles would operate pumps, and buoys that use wave-powered flap valves to displace air and drive air turbines. Large-scale devices employing any of these three designs could achieve practical efficiencies of 25 to 50% and provide an average of 10 megawatts of power. A voltaic cell that takes advantage of the differing levels of salinity in the ocean and fresh water, a heat engine using temperature differences between surface and deep water, and a generator powered by ocean currents are also mentioned. Tidal energy, though available for use at only a limited number of sites, may nevertheless provide the most economical and effective use of ocean energy. Development of the Rance estuary power station in France, which has a generating capacity of 240 megawatts, is described, and other possible installations in England and France are also considered. J M B

**A77-42406** Vapor-liquid equilibrium of hydrogen/tetralin system at elevated temperatures and pressures J J Simnick, C C Lawson, H M Lin, and K C Chao (Purdue University, West Lafayette, Ind.) *AIChE Journal*, vol 23, July 1977, p 469-476 22 refs. Research supported by the Electric Power Research Institute

A flow type of apparatus is built to give equilibrium gas and liquid samples at elevated pressures and temperatures while minimizing thermal decomposition. Saturated vapor and liquid compositions and K values are determined with this apparatus for the binary system hydrogen/tetralin (1,2,3,4-tetrahydronaphthalene) at four temperatures from 189.6 to 389.1 C, and seven pressures from 20 to 250 atm. Vapor pressures of tetralin are determined with the same apparatus, and values are reported at the four temperatures of this work. (Author)

**A77-42407** Absorption of sulfur dioxide into aqueous sodium hydroxide and sodium sulfite solutions H Hikita, S Asai, and T Tsuji (Osaka Prefecture University, Sakai, Japan) *AIChE Journal*, vol 23, July 1977, p 538-544 20 refs

The rates of absorption of pure sulfur dioxide into aqueous sodium bisulfite, sodium hydroxide, and sodium sulfite solutions with and without a surface active agent were measured at 25 C using a liquid jet column. For the sulfur dioxide-sodium hydroxide system, the rate of absorption into the solution without surface active agent was higher than that into the solution with surface active agent, indicating the existence of the interfacial turbulence. The absorption rates obtained for the present system under the conditions of no interfacial turbulence were in good agreement with the theoretical predictions based on the penetration theory. (Author)

**A77-42408** Charge characteristics of particles in coal derived liquids - Measurement and origin J D Henry, Jr and M T Jacques (West Virginia University, Morgantown, W Va.) *AIChE Journal*, vol 23, July 1977, p 607-609 11 refs. Contract No E(40-1)-5105

Measurements carried out on the sign of charges associated with particulates present in an unfiltered Solvent Refined Coal liquid with an initial 3:1 solvent/coal ratio are reported. A mechanism is advanced to account for both origin and sign of the observed charges. The origin of the net positive surface charge associated with electrophoretic mobility in coal-derived liquids is accounted for in terms of the acid base structure of asphaltic species, and the presence of protons. Positive charge is found conferred to particulate matter suspended in hydrogen donor solvent. The results are relevant to studies of electrically induced separations, interfacial collection or distribution to water for particulates removal, or flocculation. R D V

**A77-42412** Photocell using covalently-bound dyes on semiconductor surfaces M Fujihira, N Ohishi, and T Osa (Tohoku University, Sendai, Japan) *Nature*, vol 268, July 21, 1977, p 226-228 15 refs

Sensitization of tin oxide or titanium oxide photocells to wavelengths of light longer than ultraviolet may be achieved by chemically modifying the surface of photoelectrodes in aqueous media. Surface modification procedures are described, and tests are made of the spectral sensitization resulting from the progress of photocurrent spectra obtained from an amide-linked rhodamine B electrode and an ester-linked rhodamine B electrode are compared, while the spectra are identical in shape, the photocurrent of the ester-linked dye electrode is found to be two orders of magnitude greater than that of the amide-linked electrode. In the case of the amide-linked dye electrode, a nonconducting alkyl chain is suggested to act as an energy barrier intervening between semiconductor and dye, inhibiting adsorption of excited dye molecules by the electrode. The conjugated pi electronic system of the ester-linked electrode, which is less distant from the semiconductor, apparently results in a more efficient sensitization. J M B

**A77-42475** Large-scale applications of superconductivity. B B Schwartz and S Foner (MIT, Cambridge, Mass.) *Physics Today*, vol 30, July 1977, p 34, 35, 37-40, 42, 43. NSF-supported research

Engineering characteristics of superconducting materials are reviewed, and several applications of superconductors are given, including use in electrical motors and generators, as magnets for MHD and fusion power generators, as power transmission cables, and in magnetic levitation of high-speed vehicles. Properties of commercially available superconductors are discussed, and current approaches to engineering failure-proof superconductivity are considered, i.e., cryostatic stabilization, adiabatic stabilization, and dynamic stabilization. Problems in replacement of the copper conductors and iron flux circuits of generators by superconductors are mentioned, and the development of homopolar dc rotating machines is described. The three principal magnet confinement schemes for fusion reactors, Tokamak, magnetic mirror, and theta pinch, are also reviewed. Use of superconducting cables for power transmission, which presents some technological difficulties, could provide an extremely efficient alternative to present transmission lines. Magnetic levitation and propulsion by magnetic flux are described, with emphasis on the high speeds attained by the vehicles, and the low mechanical stresses to which they are subjected. J M B.

**A77-42482 #** A pressurized fluidized bed coal fired combined cycle electric power generation S Moskowitz (Curtiss-Wright Corp., Wood-Ridge, N.J.) *AIAA, EEl, and IEEE, Conference on New Options in Energy Technology, San Francisco, Calif., Aug 2-4, 1977, AIAA Paper 77-1013* 9 p

The combination of pressurized fluidized bed (PFB) technology and the gas-turbine - steam-turbine combined-cycle power system offers a unique opportunity for the production of clean cost-competitive electric power from the combustion of high-sulfur coal. It also offers the prospect of earlier commercialization than those systems requiring gasification or liquification of coal to clean fuels. The U.S. Energy Research and Development Administration is

sponsoring a project to design, construct, and operate a coal-fired PFB/gas turbine pilot electric power plant. The pilot plant, which will produce an equivalent of 16 MW of power, will address a number of key technical issues associated with PFB development. It will also provide design data to verify scale up of the PFB units to a commercial plant size suitable for the electric utility industry. The principles and advantages of fluidized bed combustion are described along with the concepts for integrating the combustor into a combined-cycle power plant. The development program and the results to date are briefly reviewed. (Author)

**A77-42483 # Large-scale space operations for Solar Power Satellites.** G. R. Woodcock (Boeing Aerospace Co., Seattle, Wash.). *AIAA, EEL, and IEEE, Conference on New Options in Energy Technology, San Francisco, Calif., Aug 2-4, 1977, AIAA Paper 77-1031* 16 p 9 refs

Analogies with industrial development and with the Saturn, Shuttle, and Skylab programs demonstrate the feasibility of Solar Power Satellites (SPS) that require space launch rates countable in flights per day, systems with very large mass and size, and large-scale construction techniques in orbit. SPS energy production is estimated to equal 400,000 barrels of oil per day throughout an SPS operational life of 30 years or more, low transport costs to low earth orbit and on to geosynchronous orbit are projected as a result of reusability of vehicles, high traffic volume, relatively rapid ground turnaround, and large payload capacity. Construction procedures and installation of reflector systems are discussed, and diagrams of fabrication methods and devices are presented. About 10 manhours would be needed to erect one ton of material, and a workforce of 500 to 700, working 10-hour shifts 6 days a week during a 90-day orbiting period, is projected. J M B

**A77-42556 Solar electricity - The hybrid system approach.** M. A. Duguay (Bell Telephone Laboratories, Inc., Holmdel, N.J.). *American Scientist*, vol. 65, July-Aug 1977, p. 422-427. 21 refs

Procedures for combining solar electrical generation with other services, such as heating and lighting, are discussed. In one hybrid system, a cylindrical mirror-type concentrator focuses light on a photovoltaic cell which transforms 10 to 20% of it to electricity. The solar cell is attached to a water pipe, and the remaining energy appears as heat which is recovered via the water pipe. In another hybrid system, the visible part of sunlight is used for lighting and the IR is converted to heat and electricity in solar cells. This system uses a 'cold' mirror which is a dielectric filter reflecting visible light and transmitting IR. The economics of these hybrid systems is considered. M L.

**A77-42560 # Solar satellites - Space key to our power future.** G. R. Woodcock (Boeing Aerospace Co., Seattle, Wash.). *Astronautics and Aeronautics*, vol. 15, July-Aug 1977, p. 30-43

Technology, costs, and environmental problems associated with Solar Power Satellites (SPS) are discussed, and the system is found to be a feasible alternative to other energy sources. The microwave transmission system of the SPS, employing phased array radar technology, is analyzed, transmission efficiencies of 60 to 70% are projected. Furthermore, the type of microwave used and the limits imposed on maximum beam strength would permit conformity with the most stringent public exposure standards in effect. An operational life of 30 years for the system, together with development of effective delivery programs and space construction techniques, would bring the cost of energy produced by SPS to competitive levels, a complete payback for the system may be expected after 1 to 3 years of operation. Design of the receiving antenna is considered, and a comparison is made between silicon photovoltaic cells and Brayton heat engines, two candidates for the energy conversion system. Development time for the entire SPS program is estimated. J M B

**A77-42561 # Creating a welcome for aerospace energy technology.** J. Grey (American Institute of Aeronautics and Astronautics, Inc., New York, N.Y.). *Astronautics and Aeronautics*, vol. 15, July-Aug 1977, p. 44-47

The role of the aerospace industry in developing alternate energy sources is discussed. In spite of the relatively limited funding

presently allotted by the Energy Research and Development Administration (ERDA) to aerospace technologies, and the small size of the aerospace component within the total energy research effort undertaken by private industry, there are many areas in which aerospace expertise is needed, including advanced combustion technology aimed at nitrogen oxide control and lower combustion noise levels, gas turbine systems, and first wall systems for magnetically contained fusion power plants, aerodynamic design to reduce fuel consumption, metallic, ceramic, and composite materials for high temperature and pressure environments, photovoltaic cells and collector/absorber systems for energy storage and transmission, transport and design of space-based solar power systems (SSPS), and ocean thermal energy conversion systems. In particular, development of SSPS, which presently receives very low funding, deserves additional attention. J M B

**A77-42590 Management analysis of nuclear allocation for the generation of electricity.** P. T. Antonopoulos and J. C. Turnage (Yankee Atomic Electric Co., Westboro, Mass.). *Nuclear Technology*, vol. 34, Aug 1977, p. 347-361. 15 refs

In an effort to provide a basis for satisfying nuclear utility needs in generation planning, an improved computational tool has been developed that is capable of determining near-optimal operating strategy for generation systems comprised of nuclear, fossil, hydro, and pumped storage units. This strategy attempts to minimize the system generation costs while maintaining an acceptable system reliability. The computer program developed, MANAGE, is capable of performing scoping calculations to analyze multicycle fuel management options. In applying MANAGE, the techniques of risk and decision analysis are found to be useful approaches to utility system planning under uncertainty. (Author)

**A77-42628 Predicted and measured finite-width effects in linear induction machines.** E. S. Pierson (Illinois University, Chicago, Ill.), R. Hanitsch, T. Huhns (Berlin, Technische Universität, Berlin, West Germany), and H. Mosebach (Braunschweig, Technische Universität, Braunschweig, West Germany). (*Institute of Electrical and Electronics Engineers, Annual Meeting, 10th, Atlanta, Ga., Sept. 28-Oct. 2, 1975*) *IEEE Transactions on Power Apparatus and Systems*, vol. PAS-96, July-Aug 1977, p. 1081-1086. 12 refs

A new method of calculating the variation of the magnetic flux density with the dimension perpendicular to the flux and motion directions has been developed for MHD induction machines. The force and power densities and totals are also determined. The new method is explained and compared with previous methods of calculating finite-width effects. The agreement of the calculated field profiles with some initial measurements is excellent. (Author)

**A77-42629 Finite length effects in linear induction machines with different iron contours.** H. Mosebach (Braunschweig, Technische Universität, Braunschweig, West Germany), T. Huhns (Berlin, Technische Universität, Berlin, West Germany), E. S. Pierson (Illinois University, Chicago, Ill.), and D. Herrmann (Institute of Technology, Bandung, Indonesia). (*Institute of Electrical and Electronics Engineers, Annual Meeting, 10th, Atlanta, Ga., Sept. 28-Oct. 2, 1975*) *IEEE Transactions on Power Apparatus and Systems*, vol. PAS-96, July-Aug 1977, p. 1087-1093. 20 refs

Finite iron and winding lengths are significant factors in determining the performance of linear induction machines. This study provides information on the effect of the iron contour on machine performance, and also aids in the evaluation of other analytical models by pointing out the importance of the proper treatment of finite iron length. The analytical model used here, developed by Mosebach, is based on Fourier series expansions of the electromagnetic quantities and the air-gap length. The magnetic flux density, current density, force density, and efficiency are compared for six iron contours. One case with a graded winding is also considered. (Author)

**A77-42632 Electric energy alternatives appraisal for New York State.** M. Becker (Rensselaer Polytechnic Institute, Troy, N.Y.) and A. Kaufman (New York State, Dept. of Public Service, Albany, N.Y.). (*Institute of Electrical and Electronics Engineers, American*

*Society of Mechanical Engineers, and American Society of Civil Engineers, Joint Power Generation Conference, Buffalo, N Y, Sept 19-23, 1976* ) *IEEE Transactions on Power Apparatus and Systems*, vol PAS-96, July-Aug 1977, p 1173-1178, Discussion, p 1178 Research supported by the New York State Energy Research and Development Authority

This paper describes a cooperative program involving staff of RPI, New York State, and the General Electric Company for appraisal of electric energy alternatives. The program has involved acquisition of a data base describing both established and potential technologies for the generation of electric energy, identification of relevant factors, considerations and policies with potential for influencing strategy selections, and the development of methods for processing the available information. This paper will provide an overview of the program and will discuss specific examples of results obtained to date (Author)

**A77-42633** Putting alternative sources of energy into prospective R A Budenholzer and Z Lavan (Illinois Institute of Technology, Chicago, Ill ) (*Institute of Electrical and Electronics Engineers, American Society of Mechanical Engineers, and American Society of Civil Engineers, Joint Power Generation Conference, Buffalo, N Y, Sept. 19-23, 1976* ) *IEEE Transactions on Power Apparatus and Systems*, vol PAS-96, July-Aug 1977, p 1190-1195 11 refs

Proposed alternate forms of energy are compared with traditional energy sources for their possible respective contributions to meeting the nation's energy needs over the next several decades. Sources of energy consumption (residential/commercial, industrial, transportation, and electric power generation), estimated reserves of fossil fuels, and uranium fuel reserves are tabulated. The alternative sources discussed are nuclear power, hydroelectric and tidal power, oil shale and tar sand, synthetic fuel, geothermal energy, ocean thermal gradients, solar energy, and wind energy R D V

**A77-42634** The interaction of batteries and fuel cells with electrical distribution systems - Line commutated converter interface D P Carroll, G E Gareis, C M Ong (Purdue University, West Lafayette, Ind ), and P Wood (Westinghouse Research and Development Center, Pittsburgh, Pa ) (*Institute of Electrical and Electronics Engineers, Winter Meeting, New York, N.Y., Jan 30-Feb 4, 1977* ) *IEEE Transactions on Power Apparatus and Systems*, vol PAS-96, July-Aug 1977, p 1202-1210 5 refs Research supported by the Electric Power Research Institute

Prominent problems confronting energy storage or energy conversion technologies on a utility distribution system, and parameters of major concern in the specification and design of conversion equipment and ancillary equipment, are addressed. The performance of the line-commutated converter and force-commutated converter is compared. Three-phase computer simulations of typical system configurations aid a study of steady-state and transient phenomena. Equivalent circuits of battery and fuel cell modules are constructed, and studies are made of capacitor switching and load switching, ac voltage disturbances, power changes and load following, power reversal, system faults, and dc interruption R D V

**A77-42635** The interaction of batteries and fuel cells with electrical distribution systems - Force commutated converter interface G E Gareis, D P Carroll, C M Ong (Purdue University, West Lafayette, Ind ), and P Wood (Westinghouse Research and Development Center, Pittsburgh, Pa ) (*Institute of Electrical and Electronics Engineers, Winter Meeting, New York, N Y, Jan 30-Feb 4, 1977* ) *IEEE Transactions on Power Apparatus and Systems*, vol PAS-96, July-Aug. 1977, p 1242-1250 7 refs Research supported by the Electric Power Research Institute

Use of a force-commutated converter (FCC) system incorporating phase angle voltage regulation (PAVR) is studied by a simulation technique. A second 12-pulse bridge was added to implement PAVR, the effects of the commutation circuits were added to the converter simulation, the ac system was expanded, and harmonic filters were added. Principal objectives of the study are (1) ascertain the effect

of various dc sources on the operating characteristics of a FCC system, (2) identify any problems in the operation of the converter system on a utility system, and (3) evaluate the FCC performance as compared to that of a line-commutated converter using the same dc sources and ac system R D V

**A77-42636** Hybrid simulation of fuel cell power conversion systems L H Michaels, B T Fairchild (Electronic Associates, Inc, West Long Branch, N J ), and S T Kohn (United Technologies Corp, Power Systems Div, South Windsor, Conn ) (*Institute of Electrical and Electronics Engineers, Winter Meeting, New York, N Y, Jan 30-Feb 4, 1977* ) *IEEE Transactions on Power Apparatus and Systems*, vol PAS-96, July-Aug 1977, p 1329-1336 5 refs

Simulation techniques and results are presented for hybrid computer studies of line-commutated and self-commutated three phase bridge inverters. The line-commutated bridge system included constant extinction angle control of the inverter, power regulation of the DC source, and power factor correction capacitors. Simulation of this system was performed in real-time which allowed testing of prototype control hardware. The self-commutated system consists of three bridges operating in a phased sequence which permits elimination of harmonics by cancellation. System performance is evaluated with the inverters operating into a three phase load, part of which is supplied by the utility system. The paper discusses the computational techniques used in simulating systems of this type, including the role of the digital and analog computers in each study. This work supports the conclusion that hybrid simulation is a valuable tool for analysis and evaluation of power conversion systems which contain current switching devices (Author)

**A77-42637** An econometric analysis of energy over the next 75 years R W Schmitt, D J BenDaniel, P J Stewart (General Electric Co, Schenectady, N Y ), and A S Manne (Stanford University, Palo Alto, Calif ) (*Institute of Electrical and Electronics Engineers, American Society of Mechanical Engineers, and American Society of Civil Engineers, Joint Power Generation Conference, Buffalo, N Y, Sept 19-23, 1976* ) *IEEE Transactions on Power Apparatus and Systems*, vol PAS-96, July-Aug 1977, p 1353-1361 6 refs

The mix of base-load power generation systems expected from various energy sources over the next 75 years is studied. The longer-run projection is recommended as a corrective for short-range forecasts ignoring some constraints which emerge only in the long run. Lead times for significant contributions of new and presently untested technology to electrical energy demand are taken into account, research expenditures on highly speculative energy technologies (fusion, solar electric, and MHD) are not expected to yield results in less than half the time covered. The prediction model accounts for electrical and nonelectrical energy, price-induced energy conservation, and substitution of energy forms. Liquid-metal-cooled fast breeders are assumed as the nuclear power workhorse in the scenario R D V

**A77-42740** Energy reduction in cleaning exhausts containing particulates and noxious gases S V Sheppard and W L Klugman (Ceilcote Co, Berea, Ohio ) (*American Society of Heating, Refrigerating and Air-Conditioning Engineers, Semiannual Meeting, Chicago, Ill, Feb 13-17, 1977* ) *ASHRAE Transactions*, vol 83, pt 1, 1977, p 625-633, Discussion, p 634

This paper reviews the different types of gas cleaning equipment in terms of energy consumption and focuses upon new equipment designs which are capable of giving greater collection efficiency at lower energy uses. Newer designs which will be evaluated are wet scrubbers using electrostatic augmentation, crossflow packed scrubbers using flux forces and condensation, and scrubbers using waste thermal energy. These are energy efficient scrubbers that in many applications can operate at hydraulic power of less than 3 hp per 1000 ACFM (13 w per 10 cu m/hr) and give good removal efficiencies on particles having an aerodynamic cut diameter of 2 microns and smaller and extending into the submicron range. An example showing a comparison of first costs and annual costs of

operating scrubbing systems required to give cleaned air meeting environmental protection requirements and hygienic threshold limits will also be included (Author)

**A77-42741 Thermal storage - It saves and saves and saves** R T Tamblin (Engineering Interface, Ltd, Willowdale, Ontario, Canada) (*American Society of Heating, Refrigerating and Air-Conditioning Engineers, Semiannual Meeting, Chicago, Ill, Feb 13-17, 1977*) *ASHRAE Transactions*, vol 83, pt 1, 1977, p 677-684, Discussion, p 685, 686

It is pointed out that thermal storage can be a powerful energy conservation tool which can minimize the cost of energy in three ways related to the saving of fuel, the reduction of electric cooling demand, and the reduction of electric utility investment. The cost of committing waste heat to storage may be less than one-quarter of the energy required for the generation of new heat. Attention is given to the cost of thermal storage, the expansion of a central chilled water plant, financial considerations regarding the storage for a new commercial building, questions of thermal location, aspects of thermal storage interconnection, and thermal storage problems. G.R

**A77-42784 \* # The aircraft energy efficiency active controls technology program.** R V Hood, Jr (NASA, Langley Research Center, Hampton, Va) In *Guidance and Control Conference*, Hollywood, Fla, August 8-10, 1977, Technical Papers

New York, American Institute of Aeronautics and Astronautics, Inc., 1977, p 279-285 9 refs (AIAA 77-1076)

Broad outlines of the NASA Aircraft Energy Efficiency Program for expediting the application of active controls technology to civil transport aircraft are presented. Advances in propulsion and airframe technology to cut down on fuel consumption and fuel costs, a program for an energy-efficient transport, and integrated analysis and design technology in aerodynamics, structures, and active controls are envisaged. Fault-tolerant computer systems and fault-tolerant flight control system architectures are under study. Contracts with leading manufacturers for research and development work on wing-tip extensions and winglets for the B-747, a wing load alleviation system, elastic mode suppression, maneuver-load control, and gust alleviation are mentioned. R D V

**A77-42854 Environmental Pollution Symposium on Practical Alternatives to Present Urban Life, 5th, Menlo Park, Calif, May 12, 13, 1976, Proceedings** Symposium sponsored by the Peninsula Professional Societies *Water, Air, and Soil Pollution*, vol 7, Feb 1977 139 p

Attention is given to possible solutions to the United States energy dilemma, the effects of restricting the availability of nuclear energy, the prospects of renewable energy sources, and a methodology for the implementation of energy saving technologies. Also considered are the alternative roles of transportation in urban planning, the augmented ingestion of carbon monoxide and sulfur oxides by occupants of vehicles while idling in drive-up facility lines, and the Modular Integrated Utility System as a potential influence on community development. B J

**A77-42855 The United States energy dilemma - How can we solve it** G R Hill (Electric Power Research Institute, Palo Alto, Calif) (*Peninsula Professional Societies, Environmental Pollution Symposium on Practical Alternatives to Present Urban Life, 5th, Menlo Park, Calif, May 12, 13, 1976*) *Water, Air, and Soil Pollution*, vol 7, Feb 1977, p 141-146

The basis for the present energy dilemma is described. The current solution to the inadequate petroleum and natural gas supplies and possible long-term solutions are developed. Current efforts within ERDA and by industry and the public to help solve the problem are considered. An important element in solving the problem is the establishment of platforms where effective dialogue can be developed between those concerned with the environment and those trying to produce energy. There the necessary tradeoffs can be discussed and an action plan developed. Finally, possible

mechanisms for moving toward energy independence are suggested (Author)

**A77-42856 Patterns of energy use and the critical choices ahead** S O Blois (Pacific Gas and Electric Co., San Francisco, Calif) (*Peninsula Professional Societies, Environmental Pollution Symposium on Practical Alternatives to Present Urban Life, 5th, Menlo Park, Calif, May 12, 13, 1976*) *Water, Air, and Soil Pollution*, vol 7, Feb 1977, p 147-164

Patterns of contemporary and projected energy use in the US are presented with attention to the industrial, commercial, residential, and agricultural sectors. The patterns in northern and central California are compared with national patterns. Factors that could modify the projected patterns are discussed, and attention is directed to end-use applications. It is suggested that, in the immediate future, coal and conventional nuclear power will be used more than at present as sources of energy. M L

**A77-42857 Some impacts of restricting nuclear energy availability** J B Kopelman and D M Nesbitt (Stanford Research Institute, Menlo Park, Calif) (*Peninsula Professional Societies, Environmental Pollution Symposium on Practical Alternatives to Present Urban Life, 5th, Menlo Park, Calif, May 12, 13, 1976*) *Water, Air, and Soil Pollution*, vol 7, Feb 1977, p 165-174 6 refs

Although the present average costs of generating electricity from nuclear reactors are less than the average cost of power from fossil fuel plants, the pressures for additional regulatory controls on nuclear power plants raise the possibility that nuclear power might become unavailable as an energy alternative. With the help of a model of US interfuel competition developed at SRI, some of the implications of various alternative assumptions about the future availability of nuclear power are examined. The economic costs of a nuclear moratorium are evaluated for two different forecasts of energy demand growth. Although the loss of the nuclear option is offset by a substantial increase in eastern and western coal production, the net cost of this replacement over 20 billion dollars annually by 2000 - is substantial (Author)

**A77-42858 The prospects for renewable energy sources** J G Witwer (Stanford Research Institute, Menlo Park, Calif) (*Peninsula Professional Societies, Environmental Pollution Symposium on Practical Alternatives to Present Urban Life, 5th, Menlo Park, Calif, May 12, 13, 1976*) *Water, Air, and Soil Pollution*, vol 7, Feb 1977, p 175-180 6 refs

As the reserves of depletable fuels are consumed, their prices will increase, thus making renewable energy sources more cost competitive. SRI has evaluated the potential uses for and costs of renewable energy sources and compared them with other energy sources currently being utilized. These economic estimates serve as a basis for discussing the possible contribution that solar energy sources can make to the US energy system. Some of the technical, environmental, and institutional problems associated with each of these solar energy forms are reviewed (Author)

**A77-42859 Evaluation of energy policy** L S Windheim (Leo A Daly Co., San Francisco, Calif) (*Peninsula Professional Societies, Environmental Pollution Symposium on Practical Alternatives to Present Urban Life, 5th, Menlo Park, Calif, May 12, 13, 1976*) *Water, Air, and Soil Pollution*, vol 7, Feb 1977, p 181-185 11 refs

An energy strategy of doing more with less is urged on the grounds that it would provide more jobs, less inflation, and less pollution. The importance of conserving energy used by buildings is stressed, with attention to the role of the architect in energy conservation. Energy policies are considered with reference to the concept of entropy. Energy from the sun is said to provide a limited store of low entropy high energy fuels, and an abundance of higher entropy but continuing current energies. M L

**A77-42860 Future energy options, ethics and a case for conservation** J E Armstrong (*Peninsula Professional Societies,*

*Environmental Pollution Symposium on Practical Alternatives to Present Urban Life, 5th, Menlo Park, Calif., May 12, 13, 1976)* *Water, Air, and Soil Pollution*, vol 7, Feb 1977, p 187-194

Up to 1990 the U S must rely upon four major sources for additional energy to meet the expected continued growth in energy use (1) expanded coal and the associated synthetics fuels derived from it, (2) expanded production of continental shelf and Alaskan oil and gas, (3) nuclear, and (4) imported petroleum After 1990, solar and oil shale could play increasingly important roles as additional sources These major energy options will be compared at a national level in their broad environmental, economic, social, and political implementation impacts, with special emphasis on major effects of economic soundness, employment, food supply, national defense, and the emerging social unrest which characterizes the 1970s in the U S A It is concluded that a major energy conservation program would be a prudent course for the U S A to follow, with the stipulation that its gradual implementation over something like a 10 year time period is necessary (Author)

**A77-42891 Compact shrouds for wind turbines** O Igra *Energy Conversion*, vol 16, no 4, 1977, p 149-157 5 refs Research supported by the U S-Israel Binational Science Foundation

As part of a large project aimed at finding the optimal configuration for an aerogenerator to exploit wind power, an investigation was launched to find the most compact shroud possible The dominant contributor to the shroud length is the structure downstream of the turbine (the diffuser) This component has an ever increasing cross-section as one progresses downstream, however, fast rate of area divergence will cause flow separation and the significant reduction in output power associated with it It is the purpose of the present paper to demonstrate ways to overcome this difficulty This can be achieved either by proper diversion and introduction of the shroud's external flow into the diffuser's inner boundary layer or alternatively, by the usage of a ring-flap (Author)

**A77-42892 Radiation effects on high efficiency silicon solar cells** W. Luft (TRW Defence and Space Systems Group, Redondo Beach, Calif) *Energy Conversion*, vol 16, no. 4, 1977, p 159-167 17 refs

The performance of ten silicon solar cells currently in production was evaluated The cells represented several types enhanced cells (Ta<sub>2</sub>O<sub>5</sub> coating), hybrid cells (shallow junction/high grid density), field cells (P+ back surface field, attributes of hybrid cells), black hybrid cells (hybrid cells with low reflective surfaces) and black field cells (field cells with low reflective surfaces) A previously described (Luft, 1974) solar simulator with an estimated error of less than 3% was used in the evaluations The initial efficiencies of the cells tested ranged from 10.3 to 13.6% after prolonged illumination The cells appeared to have a small photon degradation Although the initial efficiency of the cells tested was up to 39% higher than that of conventional cells, their performance was more severely degraded by irradiation by 1-MeV electrons to a fluence of ten to the fifteenth electrons per square centimeter The highest degradation in each resistivity group was found in field cells All cells except for a cell group using float-zone material showed annealing of electron irradiation damage of up to 5% C K D

**A77-42893 The spacing of wind turbines in large arrays.** B G Newman (McGill University, Montreal, Canada) *Energy Conversion*, vol 16, no 4, 1977, p 169-171 6 refs

The effect of spacing on the power output of wind turbines in large arrays has been determined theoretically Following Templin, the effect is assessed by determining the increase in roughness of the earth's boundary layer due to the drag of the turbines The thickness of the boundary layer is assumed to change in proportion to the square root of the skin friction, which is appropriate for a turbulent Ekman layer, and differs from the assumptions made by Templin The loss of power for both flat-open country and rough-wooded country is determined as a function of the area density of the turbines, and it is found that quite large spacings are required to avoid a significant loss of power (Author)

**A77-42894 Ionization instability in non-equilibrium MHD generators.** M S Sodha, S C. Kaushik, R P Sharma, B K. Gupta, and B K Sawhney (Indian Institute of Technology, New Delhi, India) *Energy Conversion*, vol 16, no 4, 1977, p 173-180 13 refs. NSF-Navy-supported research

The growth rate of ionization instability has been investigated using the phenomenological and semi-kinetic approach and taking the temperature/velocity dependence of collision frequency into account For the semi-kinetic treatment, the Boltzmann Transfer Equation has been used taking into account the velocity dependence of collision frequency The electron collision frequency is assumed to be a power law function of the electron temperature or velocity. The exponent governs the behavior of the scattering mechanism. In both cases the dependence of electron collision frequency on electron temperature/velocity has a stabilizing effect on the growth rate of ionization instability in weakly ionized plasmas of interest in MHD generators (Author)

**A77-42895 Solar power systems** J C Denton (Energy Associates, Belton, Tex) *Energy Conversion*, vol 16, no 4, 1977, p 181-198 18 refs

A review of the principal solar power systems is presented The nature of the solar energy source is discussed starting from the energy output of the sun and covering briefly the important atmospheric effects to characterize the available solar energy on the earth's surface The various methods for capturing solar energy are presented flat-plate, concentrating, photovoltaic, and other collectors Energy storage methods are presented briefly for thermal, chemical, electrical, and mechanical storage approaches An application of solar power systems in interaction with a conventional electrical utility system is presented in terms of mode of operation (base, intermediate, and peaking), reliability, capacity displacement, and energy displacement An economic evaluation of selected solar power systems compared to conventional electrical generation plants is presented Conclusions are drawn as to the conditions under which solar power systems may become economically competitive A preliminary indication of market capture potential is discussed (Author)

**A77-42896 Economic analysis of solar total energy systems** J C Denton (Energy Associates, Belton, Tex) *Energy Conversion*, vol 16, no 4, 1977, p 199-204

An economic analysis of a solar total energy system is provided on basic investment analysis principles Assumptions and simplifications of procedure are stated Assuming that the technology becomes technologically mature in 1990, the first system built (of the type analyzed) is anticipated to have a net present value just over \$53 million based on a 25 yr economic lifetime and forecasted values for inflation rate, energy escalation rate, cost of capital, cost of operations, cost of maintenance, depreciation, construction time, costs of gas and electricity, and capital cost A specific case is analyzed Error and sensitivity analyses are not included (Author)

**A77-42897 A simplified technique for determining the boundary layer voltage loss in MHD generators** R C Dolson and O Biblarz (U S Naval Postgraduate School, Monterey, Calif) *Energy Conversion*, vol 16, no 4, 1977, p 205-211. 22 refs USAF-supported research

MHD generator performance predictions require an accurate determination of the voltage losses in the channel, however, most techniques for determining these losses need substantial calculations and/or computer storage space This paper proposes a simplified method for calculating the ohmic boundary layer contribution to the overall voltage losses Voltage drop regions are discussed and a description of the turbulent boundary layer contribution is derived Appropriate simplifying assumptions on the basic transport and MHD concepts are used to express the conductivity as a function of temperature only Weighting functions for averaging the resistivity in turbulent boundary layers are determined and the nature of these functions is presented Our results are compared with more precise descriptions and with experimental results. (Author)

**A77-42898** Economic competitiveness of windmills E E Lapin (Aerospace Corp., Los Angeles, Calif.) *Energy Conversion*, vol 16, no 4, 1977, p 213-220 9 refs

The conditions under which windmills become competitive with the generation of electric power from fossil fuels are examined. The influence of cost of construction, financing arrangements, and the future cost of fuels is shown. Energy storage and network arrangements for mills are considered briefly, as are alternate uses for mills, e.g., the utilization of mill output directly for heating or for the production of a fuel. (Author)

**A77-42954** Design of pointed solar concentrators (Conception des concentrateurs solaires pointés) R Zaharia (Centre National d'Etudes Spatiales, Paris, France) *Coopération Méditerranéenne pour l'Energie Solaire, Revue Internationale d'Héliotechnique*, no 1, 1977, p 23-30 In French

The concept of geometrical concentration, as understood in this paper, being specified, a comparison is made between two kinds of mirrors, when combined with plane absorbers: mirrors with parabolic profile and mirrors with circular profile. The influence of various geometrical aberrations being enlightened, the case of the circular cylinder linked to a defocused plane absorber is discussed. A review is made of the results and how they compare with the usual case of the parabolic cylinder linked to a pipe shaped absorber. Some guidelines for the design of thermal collectors including linear concentrators are given. (Author)

**A77-42955** Optical performance of fixed zenith-moving azimuth parabolocylindrical concentrator I A Sakr, S H Soliman, and N H Heina (National Research Centre, Cairo, Egypt) *Coopération Méditerranéenne pour l'Energie Solaire, Revue Internationale d'Héliotechnique*, no 1, 1977, p 31-39 12 refs

A study has been made on the parabolocylindrical concentrator whose central line is inclined to the horizontal with an angle of 30 deg. It can move in the azimuthal direction only. Theoretical equations have been derived to give the angle of incidence and the effective area of the concentrator over the whole year. The effect of input energy, ambient air temperature on the performance of the concentrator is shown by graphs. (Author)

**A77-42956** Optimum design of a single slope solar still in Riyadh, Saudi Arabia A A M Sayigh and E M A El Salam (Riyadh, College of Engineering, Riyadh, Saudi Arabia) *Coopération Méditerranéenne pour l'Energie Solaire, Revue Internationale d'Héliotechnique*, no 1, 1977, p 40-44 12 refs

The performance of seven reinforced-concrete solar stills in Saudi Arabia was compared. The stills varied with respect to thickness of glass cover, cover slope, absorbant materials, and sealing agent between the glass cover and the frame. Absorbant materials were red sand, black sand, straw, black dye, and charcoal. A still with 20-deg slope cover gave best performance. This still was tested with different absorbants, and the use of black stone yielded highest output. This still yields 15 liters/day and its yearly average efficiency is 45 percent. P T H

**A77-42957** Study of thermal performance of solar heating systems with storage and auxiliary heaters. L Fantini and C Pisoni (Genova, Università, Genoa, Italy) *Coopération Méditerranéenne pour l'Energie Solaire, Revue Internationale d'Héliotechnique*, no 1, 1977, p 45-52 7 refs. Research supported by the Consiglio Nazionale delle Ricerche

The thermal behavior of a solar heating system with storage and auxiliary heaters was analyzed with reference to variable thermal outdoor conditions. The analysis was carried out through a computer simulation which enables to investigate the effect on the system performance of several design parameters. In this analysis a particular storage unit of fusible solid mass was assumed and the heat capacity of the building and its effect on delaying the changes in interior temperatures was considered. The use of the program is illustrated, and the results presented show the effect on the system performance of the collector area and storage capacity. (Author)

**A77-42958** Solar heating for a sports complex in Belgium (Chauffage solaire d'un centre sportif en Belgique) G G Descy, A Grosfils, Ch Heusquin, and M Vangysel (Société d'Etudes ATRAC, Brussels, Belgium) *Coopération Méditerranéenne pour l'Energie Solaire, Revue Internationale d'Héliotechnique*, no 1, 1977, p 53-58 In French

A solar thermal system to heat a large building complex has been studied. More than 2500 sq m of plate collectors are planned. A computer model has been created. This model takes into account all the thermal loads and energy sources. This simulation is based on typical years with true hourly meteorological data based on a statistical study over 18 years in Belgium. The results give previsional energy balance and show that 57 percent of global thermal loads are assumed by solar collectors. (Author)

**A77-42959** The geometry of catoptric light II - An application to solar energy (Catoptrique geometrique application à l'énergie solaire II - Répartitions énergétiques dans les capteurs catoptriques) L Aiache and E-F Jaguaribe (Aix-Marseille III, Université, Aix-en-Provence, France) *Coopération Méditerranéenne pour l'Energie Solaire, Revue Internationale d'Héliotechnique*, no 2, 1976, p 4-10 18 refs In French

Photometric analysis of catoptric solar collectors is reviewed, with the aim of developing a description of the energy-gathering capabilities of solar collectors. The reception and reflection of optical and thermal fluxes from an extended light source are discussed for the case of a plane collector. To account for energy losses due to reflectance which may occur in photochemical collectors, the Fresnel reflection formula is introduced. Limitations of the monochromatic plane wave model for describing incident solar energy are also cited. Several methods for determining collector efficiency which do not involve the integrations used in conventional photometric analyses are given. These simplified techniques, which rely on graphical analysis of cones, are relatively general methods (i.e., are applicable to cases other than that of the parabolic mirror collector). Means of including the variability of the energy source (the sun) in the analysis are also mentioned. J M B

**A77-42961** A tubular evacuated solar collector utilizing a heat pipe as absorber U Ortabasi (Corning Glass Works Research and Development Laboratories, Corning, N Y) *Coopération Méditerranéenne pour l'Energie Solaire, Revue Internationale d'Héliotechnique*, no 2, 1976, p 14-17 Contract No E(11-1)-2608

A heat pipe evacuated tubular solar collector has been built and tested. Based on the present design, it performs somewhat less efficiently than a flat plate in a vacuum for temperatures less than 125 F. However, its performance is less dependent on the temperature of operation so that it performs better at temperatures greater than 125 F. Improvements may be possible given better mirror fabrication, heat pipe design, and antireflection coatings. (Author)

**A77-42962** Studies into reduction of radiative heat losses of flat plate solar collectors P Brennecke and E Justi (Braunschweig, Technische Hochschule, Braunschweig, West Germany) *Coopération Méditerranéenne pour l'Energie Solaire, Revue Internationale d'Héliotechnique*, no 2, 1976, p 18-24 10 refs

Flat-plate solar collectors are discussed, with attention given to cover materials and design modifications that minimize heat loss, especially radiative losses. Absorption spectra and radiative emittance are determined for several commercially-available cover materials, these data, together with information on the physical characteristics of the materials, furnish criteria for the selection of suitable covers for flat-plate collectors. Experiments are carried out to measure the efficiency of various cover materials in water-heating collector systems. A flat-plate solar collector having two plates with a trapped layer of fluid in between is also described. Whether or not the trapped fluid is circulated into the main collection chamber, the double-cover design is found to increase collector efficiency under specific conditions. J M B

**A77-43009** Desulfurization of coal by use of chemical comminution P H Howard and R S Datta (Syracuse Research Corp., Syracuse, N Y) *Science*, vol 197, Aug 12, 1977, p 668, 669 11 refs ERDA Contract No 14-32-0001-1777

Chemical comminution consists of the treatment of coal with a chemical (usually ammonia gas or a concentrated aqueous ammonia solution) Selective breakage of the coal occurs which apparently takes place along the maceral boundaries and other deposits within the material such as pyrite bands A description is given of investigations which show that selective breakage by chemical comminution can be used to desulfurize coal without excessive size reduction and without creating large amounts of fines G R

**A77-43011 #** Wave power K Hulls (New Zealand Electricity Department, Wellington, New Zealand) *New Zealand Energy Journal*, vol 50, Apr 25, 1977, p 44-48 9 refs

The amount of energy potentially available to New Zealand through the use of wave power systems is examined It is estimated that the mean power level for New Zealand is 35 kW per meter of wave front, the energy flow in 63 km of wave front is equivalent to the electrical energy consumption in New Zealand at present Assuming a conversion efficiency of 35% for wave-power devices, about 250 km of coastline would receive an energy flow sufficient to meet present energy needs Seven major problem areas requiring attention before large-scale wave-power devices can go into production are identified and discussed These include conversion devices, generation, mooring, structural loading, possible adverse environmental effects, the lack of sufficient wave data, and undersea power transmission A chart of the average wave power in different locations around the world is provided C K D

**A77-43025** Calcite-aragonite deposition in geothermal wells R James (Department of Scientific and Industrial Research, Taupo, New Zealand) *Geothermal Energy*, vol 5, July 1977, p 18-24, 26-28.

Operation of geothermal wells in the Kizildere (Turkey) geothermal field is discussed, with attention given to problems of calcium carbonate deposition in the boreholes and the introduction of a heat-exchanger to make efficient use of the relatively low temperature (200 C) of the reservoir fluid Rate and composition of the deposits, which are in the form of calcite or aragonite, are studied Lower rates of deposition are obtained as pressure in the bore increases, a pressure level above 10 bars is found to induce a relatively low amount of deposition, which, however, may be more difficult to remove Design and operation of the heat exchanger are described, and its heat transfer rate, as well as the rate of deposition in its components, is monitored Cooling of the well fluid is responsible for eliminating deposition, due to retrograde solubility of the calcium carbonate in cooler water J M B

Metallwerke, Menden, West Germany) *HLH - Zeitschrift für Heizung, Lüftung, Klimatechnik, Haustechnik*, vol 28, July 1977, p 253-256 In German

**A77-43070** Photon trapping and energy transfer in multiple-dye plastic matrices - An efficient solar-energy concentrator B A Swartz, T Cole, and A H Zewail (California Institute of Technology, Pasadena, Calif) *Optics Letters*, vol 1, Aug 1977, p 73-75 12 refs

Experiments are described illustrating enhanced photon trapping and efficient energy transfer in mixed-dye planar concentrators containing, for example, Rhodamine 6G and Coumarin 6 These concentrators intercept more of the solar spectrum to give an enhanced photon-flux gain that exceeds the single-dye concentrator It is also shown that the energy absorbed by the donor dye is transferred efficiently into the emitting acceptor by two competing processes (Author)

**A77-43093 #** Mathematical method for determining reaction networks in chemical systems (Matematicheskii sposob opredeleniya reaktsionnykh setei v khimicheskikh sistemakh) I Nemes, T Vidotsi, L Botar, and D Gal (Magyar Tudományos Akadémia, Kozponti Kémiai Kutató Intézet, Budapest, Hungary) *Archiwum Termodynamiki i Spalania*, vol 8, no 1, 1977, p 43-48 In Russian.

An exact algorithm is presented for determining the reaction network in a complex chemical system The method is illustrated by an example involving the partial oxidation and the parallel pyrolysis of methane in a flame at a temperature of 1500 K and a pressure of 2-3 atm for the purpose of obtaining acetylene and a synthesis gas Thirty-two elementary reactions are considered, with CH<sub>4</sub>, HCHO, CO, CO<sub>2</sub>, H<sub>2</sub>O, C<sub>2</sub>H<sub>4</sub>, C<sub>2</sub>H<sub>2</sub>, and C<sub>2</sub>H<sub>6</sub> as stable reactants, and O, H, OH, CHO, CH<sub>3</sub>, and CH<sub>2</sub> as unstable radicals B J

**A77-43119** Elimination of current concentration due to Hall effect by variable resistive electrodes M Numano (Kyoto University, Kyoto, Japan) *Plasma Physics*, vol 19, Aug 1977, p 777-783 6 refs

This paper deals with a theoretical investigation on elimination of current distortion caused by the Hall effect in Faraday-type MHD power generators Taking as an example an MHD generator with a pair of electrodes opposed and applying the conformal transformation technique to the generator channel, it is shown that the excessive current concentration at the electrode edges due to the Hall effect can be completely eliminated by adopting suitably variable resistive electrodes and that the current distribution in the generator channel is not influenced by the Hall effect This method is based on the principle that the induced Hall field is exactly compensated by the potential gradient produced by the current flow in the resistive electrodes The internal resistance of the generator is also calculated, and it is found that when the Hall parameter is large, the internal resistance is not so different from that of the generator with perfectly conductive electrodes This method is also applicable to generators with a different configuration (Author)

**A77-43123** Wind energy - Bounty in the breeze. C E Wise *Machine Design*, vol 49, Aug 11, 1977, p 20-22, 24-26

Wind-generated power is discussed, and development programs for several generator systems are reviewed Limitations on the wide-scale use of wind-generated power, including the variable availability of the energy source and the inherently low power-conversion coefficient of wind-energy systems, are considered estimates of the role of wind-energy in future U.S. energy consumption are given A number of wind-operated electrical generators having power ratings of 100 kW to 2.5 MW are described It is noted that the high capital costs of large systems may restrict their development J M B

**A77-43143** An engineering, geological and hydrological environmental assessment of a 250 MMSCFD dry ash Lurgi coal gasification facility M H Somerville, J L Elder, and S R Moran (North Dakota University, Grand Forks, N Dak) *Energy Communications*, vol 3, no 4, 1977, p 317-342 18 refs

A preliminary engineering, geological, and hydrological environmental assessment of a proposed 250 MMSCFD dry ash Lurgi coal gasification facility is discussed. The emission spectrum is examined on the basis of the proposed design and empirical data. The system examined utilizes approximately 13 million tons of lignite and 17,000 acre feet of water per year and consumes 6500 tons of oxygen per day. Results of the study indicate that the major gaseous effluent is CO<sub>2</sub>, that the federal limits on SO<sub>2</sub> effluent may be met, and that the atmospheric degradation criterion will be the most difficult one to meet. Preliminary data indicate that the majority of the trace elements will be concentrated in and leave the system with the ash. The probable hydrological and geological impacts pertinent to ash and sludge disposal and water table depression are discussed. It is probable that the water table will be depressed during mine operations and that some groundwater pollution will occur due to waste disposal. (Author)

**A77-43144** A two-stage forecasting methodology for developing a national energy policy. T. J. Murray (Missouri-St. Louis, University, St. Louis, Mo.) and Y. Omurtag (Missouri-Rolla, University, Rolla, Mo.) *Energy Communications*, vol. 3, no. 4, 1977, p. 407-427. 24 refs.

The problem of formulating a national energy policy is discussed. A review of the more common forecasting techniques, including regression techniques, time series analysis, spectral analysis, smoothing techniques, and S curve techniques leads to the conclusion that none completely meets the requirements for long-term energy planning. A two-stage forecasting approach is suggested. The first stage uses traditional forecasting models and techniques to generate quantitative and qualitative information which is integrated in the second stage using the Delphi technique. C. K. D.

**A77-43333** # Energy aspects of VTOL aircraft in comparison with other air and ground vehicles. W. Z. Stepniowski. *Deutsche Gesellschaft für Luft- und Raumfahrt, European Rotorcraft and Powered Lift Aircraft Forum, 2nd, Bückeburg, West Germany, Sept 20-22, 1976, Paper 23* p. 12 refs.

VTOL and rotorcraft are compared to alternate forms of cargo/passenger transportation in terms of total flight time and total fuel needs in the aggregate, specific impulse, weight/equivalent drag ratio, weight/seat-available ratio, energy/passenger seat and energy/passenger-mile ratios, and load factors. Ways of improving fuel use in flight and hover are surveyed, and the TH-100 tandem passenger helicopter concept is examined. Indirect fuel and energy consumption (in manufacturing of vehicles, maintenance of ways/roads, repair) is taken into account in the comparisons. Optimizations of energy consumption and direct operating cost are illustrated. Advantages of rotorcraft in agriculture, police patrol, forestry, rescue, and oil-rig support are noted, but attention is drawn to the trend of oil-rig location further offshore at distances where helicopter effectiveness and reliability diminish. R. D. V.

**A77-43392** \* # New options for satellite power systems (SPS). G. M. Hanley (Rockwell International Corp., Space Div., Downey, Calif.) *AIAA, EEl, and IEEE, Conference on New Options in Energy Technology, San Francisco, Calif., Aug 2-4, 1977, AIAA Paper 77-1028* 7 p. 7 refs. Contract No. NAS8-32475.

The operation of a satellite power system (SPS) involves the conversion of solar energy into electrical energy with the aid of facilities carried by a geosynchronous satellite, the transmission of the obtained energy to earth in the form of microwave radio frequency energy, and the conversion of the energy received on earth into dc current for distribution into the network. Attention is given to questions concerning suitable microwave radiation density, details of space transportation for the construction of the SPS, and suitable approaches for the transformation of the solar energy into electric energy. It appears that a Rankine cycle using cesium as the main working fluid and a steam bottoming cycle might have advantages over a Brayton cycle concept considered earlier. In the area of solar photovoltaic concepts GaAlAs cells have advantages over silicon cells related to lighter weight, efficiency, and resistance to space radiation. The required amount of gallium seems to become available. G. R.

**A77-43399** National Airlines Fuel Management and Allocation Model. D. W. Darnell (National Airlines, Inc., Miami, Fla.) and C. Loflin. *Interfaces*, vol. 7, Feb 1977, p. 1-16.

The Fuel Management and Allocation Model determines the optimal strategy for fueling aircraft and can be used to support both short and long-term planning. It has been used operationally by the Fuels Management and Flight Control Departments of National Airlines for over two years, resulting in multi-million dollar savings. The model specifies the best fueling station and vendor for each flight, based on prices, availability, fuel burn, flight data, and cost of tankerage. The model also uses extensive sensitivity analysis techniques to alert management as to when a new policy may be required. (Author)

**A77-43522** Control of air pollution sources. J. M. Marchello (Maryland, University, College Park, Md.) New York, Marcel Dekker, Inc. (Chemical Processing and Engineering Volume 7), 1976. 638 p. 282 refs. \$49.50.

Aspects of air quality management are investigated, taking into account ambient air quality, monitoring and models, emission regulations, control methods, and environmental impact. Attention is given to pollutant dynamics, pollutants in the atmosphere, particulate control equipment, gaseous pollutant control, control systems for energy conversion, control systems for manufacturing, and the costs of air pollutant control. Problems of sampling and measurement are also discussed, taking into account ambient air sampling, gas flow measurement, stack sampling, particulate matter, sulfur dioxide and sulfides, photochemical oxidants, carbon monoxide, hydrocarbons, nitrogen oxides, and odors. G. R.

**A77-43556** On the theory and solar application of inductive grids. R. C. McPhedran (Sydney, University, Sydney, Australia) and D. Maystre (Aix-Marseille I, Université, Marseille, France). *Applied Physics*, vol. 14, Sept 1977, p. 1-20. 33 refs.

A brief description is given of the rigorous formalism of Chen (1970), which describes diffraction by perfectly-conducting inductive grids. The formalism is used to prove several general properties of grids, including the relevant form of the reciprocity theorem. The theory is used to investigate the equivalent-circuit model proposed by other authors for thin grids and also to derive a monomodal model of the type first proposed by Chen. The latter model is shown to be useful even in the region where more than one spectral order propagates. The accuracy of the formalism is established by comparison of calculated results with a number of far-infrared measurements on grids. The use of grids as solar-selective elements is investigated. They are shown to be capable of providing a/e ratios of the order of 30-40, provided that they are always pointed towards the sun and the diffuse content of the illumination is low. (Author)

**A77-43566** Energy supply of the Federal Republic of Germany (Energieversorgung der Bundesrepublik Deutschland). W.-J. Schmidt Kuster and H.-F. Wagner (Bundesministerium für Forschung und Technologie, Bonn, West Germany). *Erdöl und Kohle Erdgas Petrochemie vereinigt mit Brennstoff Chemie*, vol. 30, July 1977, p. 301-313. In German.

Attention is given to strategies for planning energy research and development programs, focusing on both primary and secondary energy demand, and considering such energy sources as coal, nuclear fission (particularly fast breeder reactor technology), solar, and new sources such as wind and geothermal energy. The problems and potentials of new energy technologies such as solar heating, coal gasification, and controlled fusion are considered with a discussion of time horizons (up to 1985 and up to 2000). The potential uses of nuclear energy are discussed in detail. B. J.

**A77-43593** # Diagnostics for thermal cracking of coal volatiles in entrained-bed gasifiers. S. K. Ubhayakar, D. B. Stickler, C. W. von Rosenberg, Jr., and R. E. Gannon (Avco Everett Research Laboratory, Inc., Everett, Mass.) *Combustion Institute, Fall Meeting, La Jolla, Calif., Oct. 18-20, 1976, Paper 76-25* 27 p. 10 refs. Contract No. E(49-18)-2015.

Experimental diagnostics for determining the fraction of volatiles from entrained-bed coal gasifiers which thermally crack to condensates and low molecular weight gases are presented. These include the char diagnostic, in which the ash content in the input coal is compared with that in the solids collected in the funnel downstream of the water quench, and the gas diagnostic, in which the amount of volatiles which equilibrate with known quantities of entraining gases is determined. Results for two size-grades of Pittsburgh seam bituminous coal processed in the Avco entrained-bed gasifier are presented and analyzed. The fraction of volatiles which crack was found to increase with increased coal loading and the true volatile yield appeared to be greater for smaller particles. In addition, the amount of volatiles equilibrating with the entraining gases was found to depend strongly on the mixing characteristics of the coal-carrier stream and only weakly on the total amount produced. Volatiles not reacting with the gases crack to condensates partly within the char structure and partly in the gas phase. C K D

**A77-43705**      **On the construction of plane stationary solutions of equations for nonequilibrium magnetized plasma** V I Artemov and O A Sinkevich (*Prikladnaya Matematika i Mekhanika*, vol 40, Sept-Oct 1976, p 813-822) *PMM - Journal of Applied Mathematics and Mechanics*, vol 40, no 5, 1976, p 764-774. 19 refs. Translation

A method is proposed for obtaining steady two-dimensional distributions of the electric current and electron temperature in a magnetized nonequilibrium plasma with allowance for heat conductivity and convection. The solution is obtained in the form of asymptotic expansions in a small parameter. The procedure of obtaining a zeroth approximation for the external and internal expansions is examined. The problem of the current distribution in a channel with infinite electrodes is solved as an example. V P

**A77-44052**      **Conference on Portable Power Sources in India, 1st, Calcutta, India, May 27, 28, 1976, Proceedings** Conference sponsored by the Society for Advancement of Electrochemical Science and Technology, Chloride India, Union Carbide, and Free India Dry Accumulators, Ltd. *SAEST, Transactions*, vol 11, July-Sept 1976. 138 p

Attention is given to the development of lead-acid batteries, lead oxides and their applications in secondary batteries, different varieties of manganese dioxide for dry cells, and the performance of magnesium-lead dioxide batteries. Also considered are the performance characteristics of Ni-Cd cells, rechargeable hydrogen electrodes with Ni-Ti systems in KOH solutions, a probability model for nonuniform gas porous electrodes, and the preparation of porous carbon electrodes for low temperature H<sub>2</sub>-O<sub>2</sub> fuel cells. The ideal pore structure of carbon electrodes required for low temperature H<sub>2</sub>-O<sub>2</sub> fuel cells is discussed from the view point of formation of a stable three phase boundary as well as the diffusion of gases through electrodes. The principles of preparation of electrodes with graded pore size in this context are discussed. The future programme of work in this field is also presented. (Author)

**A77-44060**      **Electric vehicles - A major potential contribution to solution of U.S. energy problems** V A Rydbeck (General Electric Co., Schenectady, N Y) *Electric Vehicle News*, vol 6, Aug 1977, p 4-7

The possible impact of electric vehicles on fuel use patterns and on the economy as a whole is examined. Reasons for the relatively slow development of electric vehicles in the United States are considered. The costs of owning and operating gasoline powered vehicles are compared with projected costs of electric vehicles. It is estimated that operating costs of a gasoline powered vehicle, assuming the price of gasoline to be 60 cents/gal and average mileage per gallon to be of 20.4, would be 20% higher than costs for an electric vehicle, assuming a power cost of 3 cents/kWh and battery leasing costs of \$11.00/month. **A77-44178**      **Atmospheric pollution due to multi-stack emissions of medium and large-capacity thermal or thermoelectric plants** (*Inquinamento atmosferico al suolo prodotto da più camini di centrali termiche o termoelettriche di media o grande potenzialità*) R Benvenuti (Pisa, Università, Pisa, Italy) and F Giuntini (*Inquinamento*, vol 19, Apr 1977, p 53-55, 57, 59. 6 refs. In Italian)

A mathematical model for minimizing the effect of airborne pollution due to stack emissions is formulated. Two stack configurations, a linear array and a polygonal array, are treated; the calculation for the linear array is developed in detail, since it is more general and may be adapted to the polygonal case. Factors taken into account in the solution include stack height, distance between the stacks, wind direction and velocity prevailing at the site, and the amount of emissions from the stacks (the pollutant considered is SO<sub>2</sub>). Profiles showing the concentration of emitted pollutants as a function of distance from the stack array are given; maximum levels of concentration that fall below legal limits can be determined. J M B

**A77-44264**      **The influence of parameter dispersion of electrical cells on the array power output** J Bany, J Appelbaum, and A Braunstein (Tel Aviv University, Tel Aviv, Israel) *IEEE Transactions on Electron Devices*, vol ED-24, Aug 1977, p 1032-1040

Effects of the parameters of photovoltaic and chemical cells on array power output are examined; dispersion of the parameters of the not entirely identical electrical cells is taken into account. Load voltage, load current, load power, and mismatch loss (loss of power) were studied for strings or arrays of series-connected or parallel-connected cells, or a single cell. When the required number of cells in an array is determined analytically for a known cell parameter distribution, interchanges of nonidentical cells and an equivalent identical cell array becomes possible. The analysis is pursued for a large number of ideal electrochemical cells. R D V

**A77-44274** Energy conditions of welding with solar radiation A A Uglov (*Svarochnoe Proizvodstvo*, no 9, 1976, p 1,2) *Welding Production*, vol 23, Sept 1976, p 1-3 Translation

A calculation was made of the power required for welding a given material of a given thickness at a specified speed by means of a solar radiation welding device in space A general thermal balance equation is derived on the assumptions of a linear and slow-moving source, full penetration of the weld, circular weld pool with diameter equal to the weld width, which is identical on both faces, and a mean pool temperature of 1.1 times the melting temperature Heat losses by radiation and convection are taken into account The equation enables determining the required power, and for a given pool shape, one can determine the mean density of energy in the focal spot

**A77-44464 \*** Construction and interpretation of a digital inertia image A R Gillespie and A B Kahle (California Institute of Technology, Jet Propulsion Laboratory, Pasadena, Calif) *Photogrammetric Engineering and Remote Sensing*, vol 43, Aug 1977, p 983-1000 24 refs. Contract No NAS7-100

An image representing the thermal inertia in the vicinity of Pisgah Crater and Lavic Lake in Southern California has been generated from visible, near IR, and thermal images taken from aircraft Construction of the thermal inertia image required radiometric calibration and geometric rectification of the acquired images as well as registration to a topographic map The Kahle thermal model used in the construction of the thermal inertia image requires specification of albedo, topographic slope and slope azimuth, diurnal temperature range and local meteorological conditions Albedo information was derived from the visible image, digital topographic information was computed from digitized stereo aerial photographs, and thermal ranges were calculated by subtracting the predawn from the afternoon thermal image data Our computed values of thermal inertia were in close agreement with published values for similar surface materials Thermal inertia provides complementary information to conventional images of reflected solar radiation for use in lithologic mapping

**A77-44476** Calculation of monthly average insolation on tilted surfaces S A Klein (Wisconsin, University, Madison, Wis) *Solar Energy*, vol 19, no 4, 1977, p 325-329 9 refs

Several simplified design procedures for solar energy systems require monthly average meteorological data Monthly average daily totals of the solar radiation incident on a horizontal surface are available However, radiation data on tilted surfaces, required by the design procedures, are generally not available A simple method of estimating the average daily radiation for each calendar month on surfaces directly towards the equator has been presented by Liu and Jordan (1962) This method is verified with experimental measurements and extended to allow calculation of monthly average radiation on surfaces of a wide range of orientations (Author)

**A77-44477** Validity of the isotropic-distribution approximation in solar energy estimations J V Dave (IBM Scientific Center, Palo Alto, Calif) *Solar Energy*, vol 19, no 4, 1977, p 331-333 8 refs

Results of numerical simulation are presented for the diffuse and direct energy passing through a sun-facing flat surface located at the bottom of plane-parallel models of nonabsorbing, homogeneous atmospheres Computations of the diffuse component were carried out with a high degree of accuracy, and also were carried out using the well-known isotropic-distribution approximation for the sky energy It is shown that the results obtained with the isotropic-distribution approximation are consistently smaller than those obtained with the exact procedure These two sets of results can differ by a factor 1-6 depending upon the optical characteristics of the model and the position of the sun (Author)

**A77-44478** A terrestrial solar thermal electric power system - Development of basic model system T Tanaka, S Sawata, T Tani, K Sakuta, and T Horigome (Ministry of International Trade and Industry, Electrotechnical Laboratory, Tokyo, Japan) (*International Solar Energy Society, International Solar Energy Congress and Exposition, Los Angeles, Calif, July 28-Aug 1, 1975*) *Solar Energy*, vol 19, no 4, 1977, p 335-341 5 refs

A model of a solar thermal electric power system consisting of a cylindrical parabolic concentrator, a heat transfer circuit, and a storage type heat exchanger is described It features a selective surface on the absorber and a selective thin barrier on the glass envelope around the absorber and an automatic tracking system The system was tested under clear-sky conditions and a range of direct insolation values, and heat losses in the collector, collector efficiency, temperature distribution in the heat storage reservoir, and the time variation of temperature in the reservoir were measured P T H

**A77-44479** Autocorrelation and stochastic modelling of insolation sequences B J Brinkworth (University College, Cardiff, Wales) *Solar Energy*, vol 19, no 4, 1977, p 343-347 6 refs

The output of solar thermal systems is sensitive to variations in the solar energy input Among the important features of these variations is their sequential character, which has not hitherto been taken into account It is shown that the sequential characteristics of the daily insolation can be represented in simple numerical terms, derived from the autocorrelation functions of a straightforward stochastic model Synthetic sequences can then be generated, which match the long-term characteristics of the insolation with respect to its sequential properties, as well as to the seasonal trend and the variance of the fluctuations (Author)

**A77-44480 \*** Low-profile heliostat design for solar central receiver systems E Fourakis and A M Severson (Honeywell Systems and Research Center, Minneapolis, Minn) *Solar Energy*, vol 19, no 4, 1977, p 349-356 NASA-supported research

Heliostat designs intended to reduce costs and the effect of adverse wind loads on the devices were developed Included was the low-profile heliostat consisting of a stiff frame with sectional focusing reflectors coupled together to turn as a unit The entire frame is arranged to turn angularly about a center point The ability

of the heliostat to rotate about both the vertical and horizontal axes permits a central computer control system to continuously aim the sun's reflection onto a selected target An engineering model of the basic device was built and is being tested Control and mirror parameters, such as roughness and need for fine aiming, are being studied The fabrication of these prototypes is in process The model was also designed to test mirror focusing techniques, heliostat geometry, mechanical functioning, and tracking control The model can be easily relocated to test mirror imaging on a tower from various directions In addition to steering and aiming studies, the tests include the effects of temperature changes, wind gusting and weathering The results of economic studies on this heliostat are also presented (Author)

**A77-44481** Correlation equation for hourly diffuse radiation on a horizontal surface J F Orgill and K G T Hollands (Waterloo, University, Waterloo, Ontario, Canada) *Solar Energy*, vol 19, no 4, 1977, p 357-359 Department of Supply and Services of Canada Contract No. 11SQ-31040-4-2000

This paper presents an analysis of hourly diffuse radiation on a horizontal surface and recommends an equation to determine the hourly ratio of diffuse-to-total radiation received in a horizontal surface The results of the new correlation equation are compared with earlier equations with recommendations made as to its use with solar energy computer simulation programs (Author)

**A77-44483** Energy coradiation using the reversible ammonia reaction P O Carden (Australian National University, Canberra, Australia) *Solar Energy*, vol 19, no 4, 1977, p 365-378 25 refs

A system is described for the large scale generation of power from solar energy in which energy is transferred by means of the reversible chemical reaction  $2\text{NH}_3 \text{ yields } \text{N}_2 + 3\text{H}_2$  An array of pressed steel paraboloidal mirrors is employed, each having a focal absorber in which the endothermic forward reaction proceeds. The exothermic reverse reaction occurs at a common central plant and the heat energy recovered operates a thermodynamic power plant The reactants are transferred in small diameter steel piping at ambient temperature Storage of energy may be catered for by providing storage for the reactants The results so far of design studies are used to assess both the technical and economic viability of the complete scheme (Author)

**A77-44484** On the performance of cylindrical parabolic solar concentrators with flat absorbers D L Evans (Arizona State University, Tempe, Ariz) *Solar Energy*, vol 19, no 4, 1977, p 379-385 7 refs Contract No E(11-1)-2590

An integral relationship is developed for evaluating the intensity distribution on flat absorbers used with cylindrical parabolic solar concentrators Calculations are presented for perfect cross-section concentrators using various models, rim angles, off-axis angles and defocusing amounts Peak concentration ratios are shown to vary as the sine of the rim angle Off-axis and defocused operations are shown to result in considerable reduced intensities The effect of surface slope errors is also investigated Normally distributed surface slope errors with a standard deviation of 0.25 degree are shown to reduce peak intensities by more than a factor of 3 (Author)

**A77-44485** The effect of dropwise condensation on glass solar properties C K Hsieh and A K Rajvanshi (Florida, University, Gainesville, Fla) *Solar Energy*, vol 19, no 4, 1977, p 389-393

The thermal radiative properties of glass covered with dropwise water condensation on one side of a slab are analyzed with allowance for multiple reflections in a drop and the resulting energy attenuation Surface and bulk transmittance and reflectance were computed as a function of water droplet size and wavelength of incident radiation These properties were then integrated over the whole solar spectrum With dropwise condensation on one surface, the bulk solar transmittance of glass for a given drop size decreases about 48% while reflectance increases by a factor of 4.2 P T H

**A77-44486** Efficient, low cost, concentrating solar collectors N T. Pierce (MIT, Cambridge, Mass.) *Solar Energy*, vol 19, no. 4, 1977, p 395-400. 5 refs.

The paper discusses some new schemes for concentrating solar collectors. One concept uses a broad water tube absorber at the focal point so that the focusing requirements on the reflector are not too stringent and the reflector angle need not precisely match the solar elevation angle, enabling a simple drive arrangement. Another version is an array of reflecting collectors arranged in the form of a 'venetian blind'. Each reflector concentrates light upward to a flat water tube mounted behind a window in a pocket underneath the reflector above. Another idea features clear glass tubes filled with black liquid absorber. This and the other designs reported all had better performance curves than flat plate collectors. P T H

**A77-44487** Solar absorption by each element in an absorber-coverglass array D K Edwards (California, University, Los Angeles, Calif.) *Solar Energy*, vol 19, no. 4, 1977, p 401, 402. 8 refs. ERDA-supported research

**A77-44488** The architecture of a passive system of diurnal radiation heating and cooling K L Haggard (California Polytechnic State University, San Luis Obispo, Calif.) (*International Solar Energy Society, International Solar Energy Congress and Exposition, Los Angeles, Calif., July 28-Aug. 1, 1975*) *Solar Energy*, vol 19, no. 4, 1977, p 403-406

The paper describes a passive system of thermal control tested on a one-story house in Atascadero, California. It uses water bags supported on a standard metal deck to form roof water ponds which act as solar collectors for heating and as heat dissipators for cooling. The metal deck acts as a heat exchanger and finished ceiling for the interior of the house. Thermal control is provided by movable insulation panels that cover or expose the ponds. Actual costs of the system and predicted post-prototype costs are given, and some plans for possible extension of the system for more northerly climates are discussed. P T H

**A77-44489** Comparison of predicted performance of constant outlet temperature and constant mass flow rate collectors D L Siebers and R Viskanta (Purdue University, West Lafayette, Ind.) *Solar Energy*, vol 19, no. 4, 1977, p 411-413. 9 refs.

On the basis of a mathematical model for the thermal behavior of a flat plate collector, the performance of a flat plate collector operating at a constant outlet temperature was compared with that of a flat plate collector operating at constant mass flow rate for short and long periods of operation for an identical mean bulk temperature for both collectors. For the constant-outlet-temperature collector the efficiency is greater near noon and smaller during the early morning and late afternoon hours than for the constant-flow-rate collector. Over a period of a month the useful energy gain and efficiency curves are similar for both collectors. P T H

**A77-44490** Fundamental studies on heat storage of solar energy T Tanaka, T Tani, S Sawata, K Sakuta, and T Horigome (Ministry of International Trade and Industry, Electrotechnical Laboratory, Tokyo, Japan) *Solar Energy*, vol 19, no. 4, 1977, p 415-419

An analytical and experimental study was made of the effect of size and thermophysical properties of storage material on the rate of temperature increase and quantity of heat stored in the material of a sensible heat storage system for solar utilization. The effects were treated as a problem of unsteady heat conduction in a hollow cylinder and a composite hollow cylinder at the centers of which a constant heat flux is supplied. P T H

**A77-44491** Lessons learned from Atlanta /towns/ solar experiment A Weinstein, R T Duncan, Jr., and W C Sherbin (Westinghouse Electric Corp., Falls Church, Va.) *Solar Energy*, vol 19, no. 4, 1977, p 421-427

An experimental large-scale solar heating and cooling system installed at an Atlanta, Georgia site is discussed. The program emphasized development of a low-cost installation from com-

mercially-available materials, a complete instrumentation system allowed for monitoring of the facility's performance. Details of the heating system's components, including the collector array, consisting of aluminized Mylar reflectors and solar collectors, and the storage tanks, pipings and fittings, are given. Problems encountered in installation of the collectors, as well as difficulties in the pumping and drain-down systems are mentioned. The high cost of pipings, fittings and valves (three times that of the collector array) was found to be a major consideration in the design of an economical system. Data on reflector performance and collector heat production indicate that the system, in operation since February, 1976, is performing at efficiencies better than those projected. J M B

**A77-44492** Spectral reflectance of TiN/x/ and ZnN/x/ films as selective solar absorbers R Blickensderfer, D K Deardorff, and R L Lincoln (US Bureau of Mines, Albany, Ore.) *Solar Energy*, vol 19, no. 4, 1977, p 429-432. 20 refs.

**A77-44497 #** Compatible building design T L Freeman (Wisconsin, University, Madison, Wis.) *Sunworld*, May 1977, p 2-6

Architectural and civil engineering considerations essential in the design and/or remodeling of a building to facilitate maximum compatibility with retrofit of an active-type solar energy heating system are discussed. Building heat losses, suitable placement of solar collector arrays, allowing for future building in of a thermal storage unit, and appropriate piping and ducting ways are dealt with. Such planning ahead on the part of building architects and builders is recommended and addressed by the article, and could go a long way toward reducing overall solar heating system costs in the future. R D V

**A77-44498 #** Wind power for India S K Tewari (National Aeronautical Laboratory, Bangalore, India) *Sunworld*, May 1977, p 7-9

The technical and economic feasibility of wind power for rural conditions in India is assessed. Early and current wind power and windmill development are surveyed, and wind measurements on record are mentioned. The relative economics of wind power and power taken from the grid (for areas where such power is accessible) are compared for rural electrification, with base prices for power and distance (of village) from grid connections taken into account. Wind data are provided for various locations in India (design wind speed for energy maximum, power density for design wind speed, windmill hours of operation based on design speed). R D V

**A77-44499 #** Selective absorbers for flat plate collectors R M Winegarner (Optical Coating Laboratory, Inc., Santa Rosa, Calif.) *Sunworld*, May 1977, p 12-14

Data and formulas are presented to assist calculations and selection of selective absorber surfaces for flat plate collectors. Formulas for absorbance, thermal (IR) emittance, amount of heat collected by a solar collector, and economic value of energy extracted as useful heat from a collector are exhibited, along with data on EM radiation regions (wavelength ranges and transmittance of atmosphere in those ranges), data for specific absorber surfaces, and US consumer prices for residential energy. Marginal analysis for decision-making on the cost effectiveness of solar energy is recommended. R D V

**A77-44522** What's holding up coal gasification. F Hirschfeld *Mechanical Engineering*, vol 99, Aug 1977, p 32-37

The development of coal gasification facilities in the US is discussed. The role of ERDA and the Federal Power Commission (FPC) in promoting and regulating the development of coal gasification is considered, problems relating to financing, environmental impact, and administrative controls are reviewed. Several pilot plants, including those that involve hydrocarbonization or the slagging Lurgi process, as well as pilot programs involving low-Btu gas production, are discussed. Synthetic natural gas, which may ultimately be a less expensive energy source than electricity generated from coal, is also held to be advantageous in that it is storable and

can be used in satisfying peak demand, and can be used in existing gas transmission and distribution systems J M B

**A77-44557** Effects of exhaust manifold configuration on a turbocharged engine employing charge stratification P J Kern and O B Koropey (U S Military Academy, West Point, N Y ) *Society of Automotive Engineers, International Automotive Engineering Congress and Exposition, Detroit, Mich , Feb 28-Mar 4, 1977, Paper 770047* 15 p 10 refs

The reported study is concerned with the interrelationships involved when various exhaust systems are combined with the turbocharged Texaco Controlled Combustion System Two exhaust manifold configurations are studied, including a conventional cast iron manifold whose volume equals one-half the engine displacement and a thermal reactor representing a manifold of twice the engine displacement The results of the study show that a thermal reactor can provide increased energy to the turbine if the air-fuel mixture is rich enough, and heat and pressure losses are not excessive G R

**A77-44558** Design considerations on a thermal energy storage Stirling engine automobile G A A Asselman, C L Spigt, and R J Meijer (Philips' Gloeilampenfabrieken, Philips Research Laboratories, Eindhoven, Netherlands) *Society of Automotive Engineers, International Automotive Engineering Congress and Exposition, Detroit, Mich , Feb 28-Mar 4, 1977, Paper 770080* 14 p 7 refs

The external heating system of the Stirling engine enables it to be coupled to a variety of energy sources In the field of unconventional heating systems a high temperature thermal energy storage unit has been built in which, for the heat transport, use is made of the heat pipe principle Based on experience with this, design considerations are given regarding the performance of an automobile propulsion unit, for which a new concept of a Stirling engine with a variable swash-plate drive and heating by a rechargeable thermal energy storage unit are used (Author)

**A77-44559** The development of a 150 kW /200 HP/ Stirling engine for medium duty automotive application - A status report N K G Rosenqvist, S G Gummeson, and S G K Lundholm (United Stirling /Sweden/ AB and Co, Sweden) *Society of Automotive Engineers, International Automotive Engineering Congress and Exposition, Detroit, Mich , Feb 28-Mar 4, 1977, Paper 770081* 11 p 5 refs

**A77-44560** Design of the 4-215 D A automotive Stirling engine R van Giessel and F Reinink (Philips Forschungslaboratorium Hamburg GmbH, Hamburg, West Germany) *Society of Automotive Engineers, International Automotive Engineering Congress and Exposition, Detroit, Mich , Feb 28 Mar 4, 1977, Paper 770082* 15 p 5 refs

The described investigation had mainly the objective to study the capability of the Stirling engine for automotive applications A four cylinder double-acting swash-plate engine was selected because it satisfied packageability, weight, and fuel economy requirements better than other Stirling engine configurations It was found that the engine shows potential for achieving low noxious emissions excellent fuel economy, a low noise level, a performance similar to that of the untreated base-line engine, and the capability for operating on a variety of liquid and gaseous fuels G R

**A77-44563** Some UK progress in sodium sulphur technology G R Lomax (Chloride Silent Power, Ltd, England) *Society of Automotive Engineers, International Automotive Engineering Congress and Exposition, Detroit, Mich , Feb 28-Mar 4, 1977, Paper 770280* 9 p 23 refs

This paper describes some progress made in the UK on sodium sulphur cells designed for motive power applications This is an area where compatibility with vehicle design imposes design constraints on the cell The state of the art of the cell components are reviewed Most of the design problems associated with the sodium electrode have been solved Electrolyte 33 mm dia and over 500 mm long can

now be produced and the strength and conductivity can be controlled Factors controlling the rechargeability of the sulphur electrode have been studied and 90% capacity retention has been achieved for 8000 hours without any deterioration of performance A 100 Ahr cell has completed 60 charge discharge cycles without any significant deterioration of performance (Author)

**A77-44564** A new design for the high-performance sodium-sulfur battery S Hattori, M Yamaura, S Kimura, and S Iwabuchi (Yuasa Battery Co, Ltd, Takatsuki, Osaka, Japan) *Society of Automotive Engineers, International Automotive Engineering Congress and Exposition, Detroit, Mich , Feb 28-Mar 4, 1977, Paper 770281* 10 p 5 refs Research sponsored by the Ministry of International Trade and Industry of Japan

This paper describes a new design for the sodium-sulfur battery employing a new cell construction including a new method to join the solid electrolyte tube with the sodium reservoir made of metal, and an improved composition of the cell case to solve the problems of premature cell destruction and capacity decrease associated with our conventional design As a result a higher and more stable performance of the new design than that of our conventional design has been shown through various evaluation tests (Author)

**A77-44604** Recovery of energy from fracture-stimulated geothermal reservoirs A Hunsbedt, P Kruger, and A L London (Stanford University, Stanford, Calif ) *(Society of Petroleum Engineers and American Institute of Mining, Metallurgical and Petroleum Engineers, Annual California Regional Meeting, 46th, Long Beach, Calif , Apr 8-9, 1976 ) Journal of Petroleum Technology*, vol 29, Aug 1977, p 940-946 16 refs NSF-supported research

Hydrothermal energy production is investigated through laboratory experiments Topics discussed include conditions for optimum energy extraction, rock heat transfer characteristics, moving flash (boiling) fronts, reservoir pressure behavior during fluid withdrawal, the effects of cool and hot fluid recharge, and cycle production/recharge operations of fracture-stimulated hydrothermal reservoirs The experiments employ rock loadings of different porosities having characteristics that simulate those found in highly fractured regions Density stratification effects in the liquid/vapor medium are discussed, and energy extraction fractions are given for various conditions of pressure and recharge It is concluded that thermal energy stored in fracture-stimulated rock can be most effectively extracted by lowering the system pressure so that boiling is initiated within the rock reservoir J M B

**A77-44608** Comparative kinetics of high-temperature reaction between H<sub>2</sub>S and selected metal oxides P R Westmoreland, J B Gibson, and D P Harrison (Louisiana State University, Baton Rouge, La ) *Environmental Science and Technology*, vol 11, May 1977, p 488-491 11 refs U S Environmental Protection Agency Grant No R-802036

Initial rates for the reactions between H<sub>2</sub>S and MnO, CaO, ZnO, and V<sub>2</sub>O<sub>3</sub> over a temperature range of 300-800 C were determined in a thermobalance reactor All reactions were first order with respect to H<sub>2</sub>S and obeyed the Arrhenius equation The sequence MnO, CaO, ZnO, V<sub>2</sub>O<sub>3</sub> represents the relative magnitude of reaction rates determined in decreasing order MnO possessed favorable properties for a high-temperature desulfurization process, and additional research in this area is recommended (Author)

**A77-44612** Northeastern utilities are meeting the clean air challenge J J Cramer, F B Kaylor (Stone and Webster Engineering Corp, Boston, Mass ), E J Schmidt, and E R Zabolotny *Environmental Science and Technology*, vol 11, June 1977, p 556-560

The effect of the National Environmental Policy Act of 1969 and the Clean Air Act of 1970, as well as state and local regulations on the operation and expansion of utilities in the Northeastern U.S. is assessed Cases studied include conversion of coal-powered steam electric plants to oil, and the expansion of an oil-fired steam electric plant in an environmentally-sensitive area (Cape Cod, Mass ) The use of emission control equipment, such as electrostatic precipitators,

the introduction of tall and multiple-flue stack configurations, the attainment of optimal air/fuel ratios, and the use of low-sulfur fuels are considered. Climatological diffusion of SO<sub>2</sub> and the problem of sootfall are also discussed. J M B

**A77-44675** Quantitative studies on marine biodegradation of oil. III - Comparison of different crude oil residues and effects of sea water source. S J Davis, C F Gibbs, and K B Pugh (Marine Science Laboratories, Anglesey, Gwynedd, Wales) *Environmental Pollution*, vol 13, July 1977, p 203-215. 5 refs. **A77-44688** # Global problems and energy (Global'nye problemy i energiya). P L Kapitsa (Akademiya Nauk SSSR, Institut Fizicheskikh Problem, Moscow, USSR) *Uspekhi Fizicheskikh Nauk*, vol 122, June 1977, p 327-337. 8 refs. In Russian.

Processes characterized by geometric progression in amplitude and in rate of change, culminating in explosions or catastrophes, are considered in relation to global problems (population increase, energy consumption, living standards, exhaustion of natural resources - fuel and ores). The inadequacy of some renewable energy sources (solar, wind, geothermal) to meet major industrial needs is pointed out, and hazards inherent in nuclear industry (core meltdown, wastes disposal, plutonium proliferation), which could meet large-scale industrial energy needs, are discussed. Energy acquisition on a large scale via thermonuclear fusion or modifications of nuclear fission processes is considered, and energy from matter-antimatter interaction is mentioned speculatively. R D V

**A77-44690** # Analogy between thermal-convective and magnetohydrodynamic instabilities (Analogiya mezhdu teplokonvektivnoi i magnitogidrodinamicheskoi neustoiichivostiyami), la la Valdmanis and O A Kukainis *Magnitnaia Gidrodinamika*, Apr-June 1977, p 42-44. 17 refs. In Russian.

An analogy is considered between thermal-convective instability and MHD instability due to the different electromagnetic forces generated in constant as well as variable thermal and electromagnetic fields. The analogy involves the convective structure arising in fluids and gases in the presence of temperature gradients and structured motions produced in MHD systems by magnetic-field perturbations. As an example, the proposed 'bubble' instability that may arise in a variable magnetic field is examined. It is suggested that the instabilities observed during high-power operation of MHD pumps and generators might be associated with magnetic cavitation. F G M

**A77-44694** # Calculation of a three-dimensional model for a conduction MHD machine with frame-type electrodes (Raschet ob'emnoi konduktsonnoi MGD-mashiny s elektrodami ramonogo tipa). lu M Gel'fgat and L A Gorbunov *Magnitnaia Gidrodinamika*, Apr-June 1977, p 113-118. In Russian.

A finite-difference technique is outlined for computing a three-dimensional model of a channel of an MHD pump with slanted sectional frame-type electrodes. The three-dimensional nature of the electric-current distribution in the channel is taken into account, and calculations are performed for the case of a uniform velocity profile at magnetic Reynolds numbers of much less than unity. The dependence of the main MHD characteristics of the channel on electrode and channel geometry is determined. It is found that electrode impedance has a significant effect on channel efficiency. F G M

**A77-44821** # Electron concentration measurements in combustion MHD flows by submillimeter laser interferometry. S A Self, F O Reigel, R K James (Stanford University, Stanford, Calif.), and R M Clements (Stanford University, Stanford, Calif., Victoria, University, Victoria, British Columbia, Canada) *Journal of Energy*, vol. 1, July-Aug. 1977, p. 206-211. 15 refs. NSF Grant No ENG-73-04116A01.

Methods for the determination of electron concentration are discussed as an alternative to, or a check on, measurements of electrical conductivity and temperature for characterizing plasma

properties in combustion MHD flows. In particular, the interferometric method of determining the free electron concentration is analyzed, and its potential assessed. A submillimeter laser Michelson interferometer is described and preliminary measurements of electron concentration in the free jet of the Stanford M-8 combustor are reported. It appears that accurate measurements of the path integral of electron concentration can be made which give good agreement with values calculated from Saha equilibrium at temperatures measured by the line reversal technique. A measure of the electron mobility also may be obtained, and hence the electrical conductivity may be derived by a single nonintrusive measurement technique which is applicable to ash-laden flows. (Author)

**A77-44825** # MHD combustor effluent chemistry measurements using Raman scattering. A A Boiarski and R H Barnes (Battelle Columbus Laboratories, Columbus, Ohio) *Journal of Energy*, vol 1, July-Aug 1977, p 263, 264. 7 refs.

A Raman scattering technique was used to study the chemistry of effluents (CO<sub>2</sub>, N<sub>2</sub> and H<sub>2</sub>O) at the exit plane of the CH<sub>4</sub>/air combustor of an MHD generator. The key result was that potassium seed emission from the flow does not deleteriously affect Raman spectral measurements. A gas temperature determined from the N<sub>2</sub> Raman spectrum agreed reasonably well with a computed exit flow value. The experiments indicated that Raman scattering could be a powerful tool in the study of the thermochemical state of MHD combustors. B J

**A77-44975** Symposium on Engineering Problems of Fusion Research, 6th, San Diego, Calif., November 18-21, 1975. Proceedings. Symposium sponsored by the General Atomic Co., IEEE, ERDA, and ANS. New York, Institute of Electrical and Electronics Engineers, Inc., 1976. 1278 p. \$36.

The areas considered include systems engineering, superconductors, beams and sources, magnet and coil engineering, energy storage, magnetic confinement devices, plasma and energy sources, coil design, Tokamak reactors, and switches and high voltage supplies. Attention is also given to vacuum engineering, plasma heating, stress and magnetic field analysis, fusion reactors, instrumentation and data handling, reactor coil design, large power supplies, and materials, walls and blankets. **A77-45125** Acid mine drainage - The problem and the solution. J K Alderman and W M Smith (West Virginia University, Morgantown, W Va.) *Coal Mining and Processing*, vol 14, Aug 1977, p 66-68, 87, 88. 26 refs.

Acid mine drainage (AMD) in the Appalachian region, 80% of which presently originates from abandoned mines, is discussed. A history of the legislation related to AMD control in West Virginia and Pennsylvania is given, current case law suggests that mining operations that provoke AMD by disrupting the hydrology of abandoned mines may be held liable. Programs to reduce AMD, involving mine sealing, strip mine backfilling, sealing of subsidence areas and surface mine regrading, are described, and the relative cost of these techniques is evaluated. As an alternative to the conventional control methods, which are found to be increasingly expensive, mineral and metal recovery from AMD and the utilization of the by-product sludge from acid neutralization for sewage treatment or rock dust are proposed. **A77-45228** Being prepared for future Argo Merchants J Milgram (MIT, Cambridge, Mass.) *Technology Review*, vol 79, July-Aug. 1977, p 14-27. 5 refs.

Details and circumstances of the oil spill and breakup of the Argo Merchant supertanker off Nantucket (Dec 1976) are recounted, problems in containing and dispersing oil spills are surveyed, and ecotherapeutic measures are discussed. Emergency action to deal with stricken and grounded vessels, building of stronger hulls with double bottoms, preparations for cleaning up offshore spilled oil, the behavior of oil in spills and behavior of different oils on the sea, effects of wave action on the spills, characteristics of a total spill cleanup system, and uses of barriers and skimmers are discussed. Stockpiling of barriers, skimmers, storage vessels, tow vessels and barges, and preparedness of personnel trained to deal with oil spill emergencies are recommended. R D V

**A77-45303** Silicon solar cells on zone-melted silicon/graphite substrates. T L Chu, S S Chu, K Y Duh, and H C Mollenkopf (Southern Methodist University, Dallas, Tex.) *Journal of Applied Physics*, vol 48, Aug 1977, p 3576-3579. 11 refs. NSF Grant No AER-73-07843, Contract No E(04-3)-1285.

Polycrystalline-silicon solar cells deposited on graphite substrates by conventional chemical vapor deposition techniques have low conversion efficiencies due to the carrier recombinations at grain boundaries. To reduce the concentration of grain boundaries, silicon layers deposited on graphite substrates have been zone melted to increase substantially the size of silicon crystallites. Using these silicon layers as substrates, solar cells have been deposited in a one-step process by the thermal reduction of trichlorosilane containing appropriate dopants, and AM1 efficiencies of higher than 5% have been obtained for cells of about 6-sq cm area. **A77-45304** GaAs double-heterostructure photodetectors. J L Merz, R A Logan, A M Sargent (Bell Telephone Laboratories, Inc., Murray Hill, N.J.), and P L McBride. *Journal of Applied Physics*, vol 48, Aug 1977, p 3580-3587. 19 refs.

$\text{Al}_x\text{Ga}_{1-x}\text{As}$ -GaAs structures grown by LPE have been investigated for optical power conversion at 8500 Å. Comparison is made between single- and double-heterostructure configurations, both in theory and experiment, relative merits of each structure are discussed. Good I-V characteristics have been realized for these devices, with series resistance as low as 0.16 ohm. For small-area (5-6 sq mm) devices operating at a few mW power, fill factors between 0.75 and 0.81 and internal quantum efficiencies exceeding 90% have been achieved for each structure investigated. Power conversion efficiencies as high as 46% were obtained at 8500 Å, after correcting for reflection losses, this approaches the theoretical limit for space-charge-limited devices. The devices were also evaluated as solar batteries, with efficiencies of 13-14% reported, corresponding to internal efficiencies as high as 18%. (Author)

**A77-45307 \*** Power deposition in He from the volumetric He-3/n,p/H-3 reaction. R J De Young (Vanderbilt University, Nashville, Tenn.) and P A Winters (NASA, Langley Research Center, Hampton, Va.) *Journal of Applied Physics*, vol 48, Aug 1977, p 3600-3602. 9 refs. Grant No. NSG-1232.

Calculations are presented in this paper which show the amount of power that can be expected to be deposited in He-3 for typical direct nuclear-pumped lasers presently in use. The calculations were performed taking into consideration the cylindrical geometry of the system, the depletion of the thermal flux across the tube cross section, and the energy loss of the protons to the cell walls. If a laser efficiency of 1% is assumed, the results indicate a steady-state laser output of 12.5 kW from a volume of 152.6 cu cm or 82 W/cu cm can be achieved. (Author)

**A77-45324** Investigating the starting modes of the GT-35 gas turbine plant. G G Ol'khovskii, L V Povolotskii, M P Kaplan, A O Bumarskov, A I Belov, L I Chernomordik, and P I Korzh (Khar'kovskii Turbogeneratortnyi Zavod, Kharkov, Ukrainian SSR, Vsesoiuznyi Nauchno-Issledovatel'skii Teploekhnicheskii Institut, Moscow, USSR) (*Teploenergetika*, Aug 1976, p 57-60) *Thermal Engineering*, vol 23, Aug 1977, p 43-46. Translation.

The paper reports on the results of tests on the startup characteristics of the GT-35 gas turbine installation forming part of a steam-gas installation, and on various factors that effect the startup characteristics. The gas turbine installation is characterized by a compressor with compression ratio of 6.5-7 and by significant pressure losses in the cycle (about 16% in nominal regime). A steam turbine consisting of a double-rimmed velocity wheel rotating at the same frequency as the main turbine shaft is used for turning the shaft during startup. The trends of the turbine and compressor efficiency under various startup regimes were plotted. It was found possible to have cold turning without ignition of the fuel up to rotational frequencies of 900 rpm at startup turbine shaft power of 900-1000 kW and up to 1250-1300 rpm at 2300 kW. Power balances for these and other regimes are shown. P T H

**A77-45325** Testing the annular combustor of the NK-8 aero-engine on natural gas. A G Tumanovskii, V N Kovalev, V G Skuridin, and F M Mingaleev (*Teploenergetika*, Aug 1976, p 60-64) *Thermal Engineering*, vol 23, Aug 1977, p 47-50. Translation.

The conditions in the annular combustion chamber of a turbopump engine were studied during combustion of natural gas. The front part of the chamber consists of a block of injectors arranged in two staggered rows, forming part of the annular head of the chamber. Each injector has its own swirler and stabilizer, and air is introduced gradually into the chamber. Although one of the characteristics of ignition of natural gas in highly forced combustion chambers is the loss of combustion stability as the fuel becomes richer, rich flameout was not attained in the present experiments even at air temperature at burner inlet of 30-50°C and air velocity at inlet of 120-130 m/sec. The measurements include the burnup coefficient and temperature field characteristics as influenced by inlet conditions. P T H

**A77-45461** The utilization of solar energy in Central Europe (Sonnenenergienutzung in Mitteleuropa). K R Schreitmüller (Deutsche Forschungs- und Versuchsanstalt für Luft- und Raumfahrt, Institut für technische Physik, Stuttgart, West Germany) *DFVLR-Nachrichten*, July 1977, p 856, 857. In German.

The reported investigation shows that an economic utilization of solar energy under the climatic conditions of Central Europe in a number of application areas is presently already possible. However, for such a utilization, it is necessary to select the components of the considered system with care and to employ optimal dimensions. Approaches for determining optimal system dimensions are discussed, taking into account the importance of model calculations for evaluating the effect of the individual parameters. An implementation of the discussed approaches is illustrated with the aid of an example involving the use of a solar energy/oil hybrid heating system for a one-family house. G R

**A77-45499** Solar energy in Australia. R N Morse (Commonwealth Scientific and Industrial Research Organization, Melbourne, Australia) *Ambio*, vol 6, no 4, 1977, p 209-215. 10 refs.

Solar energy research and development programs in Australia, designed to generate as much as 20% of the nation's energy needs by the year 2000, are discussed. Rates of consumption for national reserves of petroleum, coal, and natural gas, as well as for imported fossil fuels, are given for 1975 and forecast for 2000. High-efficiency solar heat generators, operating at temperatures up to 150°C, may eventually be capable of supplying 40% of the nation's heating requirements, solar water heaters for residential purposes may fill 60 to 80% of that requirement. An industrial process using solar power in the conversion of wood cellulose to ethanol, a possible substitute for petroleum-derived fuels in transportation systems, is also described. In general, energy production combining both solar power methods and conventional techniques seems likely to prevail in Australia through the year 2000. J M B

**A77-45543** Utilization of transparent heat-reflecting coatings in solar-energy converters. M M Koltun and Sh A Faiziev

(Akademiia Nauk Uzbekskoi SSR, Fiziko-Tekhnicheskii Institut, Tashkent, Uzbek SSR) (*Geliotekhnika*, no 1, 1977, p 28-31) *Applied Solar Energy*, vol 13, no 1, 1977, p 23-26 11 refs Translation.

The paper describes the optical characteristics (integrated transmission coefficient and integrated coefficient of thermal emission) of ZnS-Ag-ZnS coatings on substrates of glass and polymeric film. The coating finds application in the annealing of the radiation defects of silicon solar cells and as a heat-reflecting layer in high-voltage photoelectric converters B J

**A77-45544** Combination of focons and foclines with radiation receivers V K. Baranov (*Geliotekhnika*, no 1, 1977, p 32-37) *Applied Solar Energy*, vol 13, no 1, 1977, p 27-31 8 refs Translation

The paper describes solar collectors which operate in conjunction with focusing concentrators and focusing lenses. It is shown that binary systems consisting of focusing concentrators and lenses connected by small apertures can be used to reduce the angle of exit of rays from the system. The use of this binary system reduces the geometrical coefficient of concentration, but also reduces the angle of exit of rays from the system B J

**A77-45545** Using lasers to inspect solar-energy reflectors. R. A. Zakhidov, P. A. Panov, and V. N. Sokolov (Akademiia Nauk Uzbekskoi SSR, Tsentral'noe Proektiro-Konstruktorskoe i Tekhnologicheskoe Biuro Nauchnogo Priborostroeniia, Uzbek SSR) (*Geliotekhnika*, no 1, 1977, p 38-41) *Applied Solar Energy*, vol 13, no 1, 1977, p 32-34 7 refs. Translation.

The paper describes the application of laser beam diagnostics to the inspection of the accuracy of a solar reflecting surface. The system uses the LG-75 helium-neon laser at 6328 Å, with an output power of 25 mW, the collimator has amplifications of 30 and 60 times. The configuration of focal spots of separate facets of a paraboloidal collector inspected by the laser system is presented B J

**A77-45546** Paraboloid-hyperboloid concentrating systems and their accuracy. R. A. Zakhidov and A. A. Vainer (Akademiia Nauk Uzbekskoi SSR, Fiziko-Tekhnicheskii Institut, Tashkent, Uzbek SSR) (*Geliotekhnika*, no 1, 1977, p 42-49) *Applied Solar Energy*, vol 13, no 1, 1977, p 35-40 10 refs. Translation

A general method is presented for calculating the distribution of the radiant vector in paraboloid-hyperboloid solar concentrating systems. An investigation of the accuracy characteristics of systems with concave hyperboloid surfaces establishes that the accuracy of such systems is almost totally determined by the accuracy of the primary mirror B J

**A77-45547** Conjugate cycles of single-loop solar power and refrigeration plants. V. A. Grilikhes, V. S. Evseev, and V. V. Chikovani (*Geliotekhnika*, no 1, 1977, p. 50-58) *Applied Solar Energy*, vol 13, no 1, 1977, p 48-51 5 refs Translation

The possibility of realizing more than one thermodynamic cycle in single circuit thermal energy systems is discussed from the standpoints of topology and thermodynamics. Attention is given to the general characteristics of using combined cycles in solar refrigerating systems with radiant energy concentrators and radiative heat transfer into the ambient medium B J

A Miroshnichenko, and B I Terekhovskii (Akademiia Nauk Ukrainskoi SSR, Institut Elektrodinamiki, Kiev, Ukrainian SSR) (*Teplofizika Vysokikh Temperatur*, vol 14, Nov-Dec 1976, p 1329-1331) *High Temperature*, vol 14, no 6, May 1977, p 1193-1195 Translation

Blowing the electrodes with a gas mixture can lead to an inadmissible impurity content of more than 1% and to impairment of stoichiometry in the main flow of MHD-generators The aim of the experiments described in the present paper was to study the effects of blowing standard metal electrodes with an air-gas mixture and with natural gas, with a view toward developing methods of improving electrode efficiency Since such methods of protecting electrode surfaces can impair the electric insulation provided by the gas, the electric strength of gas-insulated electrodes and of electrodes employing a fireproof insulating ceramic in the gap was investigated It was found that blowing with gas mixtures is a much more effective

means of improving the electric strength than the use of monolithic ceramic insulation and that blowing with natural gas is distinctly inferior to blowing with air-gas mixtures V P

**A77-46093** **Energy supply to the year 2000 Global and national studies** Edited by W F Martin Cambridge, Mass, MIT Press, 1977 418 p \$29 95

The book reports the results of energy supply studies, conducted as an international project and involving over seventy-five people from fifteen countries Methods were developed for estimating energy supply and demand through the year 2000 and for integrating them A description is provided of the methodology and major conclusions of the supply studies Individual global overviews are included for oil, natural gas, coal, nuclear energy, other fossil fuels, and renewables such as hydroelectricity and geothermal and solar energy Individual national supply studies are discussed, giving attention to Canada, Denmark, Finland, France, the German Federal Republic, Italy, Japan, Mexico, the Netherlands, Norway, Sweden, the United Kingdom, and the U S G R

The nations considered in the studies consumed in 1972 approximately 80 percent of the total energy consumed in the world outside the COMECON countries and China A methodology section describes the adaptation of the general approach to individual national circumstances and the specific procedures used in projection energy demand An analysis section includes a discussion of the economic activity level and energy efficiency assumptions used in estimating energy use in major market sectors Another section contains summary tables and detailed worksheets presenting economic, efficiency, and energy-use data The countries considered include Canada, Denmark, Finland, France, Germany, Iran, Italy, Japan, Mexico, the Netherlands, Norway, Sweden, the United Kingdom, the U S, and Venezuela G R

**A77-46250** **Biomass energy for Hawaii Volume 1 - Summary and background Volume 2 - Sugar operations Volume 3 - Mixed municipal refuse. Volume 4 - Terrestrial and marine plantations** Edited by A Gill, C Beck, K Salvesen, L Chun, C. Yang, D Murata, and M Keller Stanford, Calif, Stanford University, 1977 Vol 1, 175 p, vol 2, 159 p, vol 3, 212 p, vol 4, 243 p Price of four volumes, \$20

The conversion of biomass resources into energy, fuels and by-products is discussed, with attention given to programs in Hawaii involving terrestrial and marine biomass plantations, energy recovery from municipal refuse treatment plants and uses for sugar cane harvesting wastes Biomass conversion processes to increase the available energy supply in Hawaii, such as direct combustion, pyrolysis anaerobic digestion or fermentation, are described In particular, the generation of electrical power from bagasse (sugar cane waste) and the production of ethanol fuel as a by-product of sugar refining are considered Schemes for exploiting municipal refuse resources, including use of pyrolytic gases in power plants, are also treated The reports emphasize an interdisciplinary approach to the energy problem, relying on legal and economic analyses as well as technical studies J M B

**A77-46401** **Gas turbines - Status and prospects; Proceedings of the Symposium, London, England, February 4, 5, 1976.** Symposium sponsored by the Institution of Mechanical Engineers. London and New York, Mechanical Engineering Publications, Ltd (I Mech E Conference Publications, No 1976-1), 1976. 164 p \$27.

Aspects of gas turbine evolution are considered along with the status and the prospects of the aircraft gas turbine, the design of gas turbines for the industrial and the marine field, the airline viewpoint, gas turbines in the RAF from a maintenance engineering viewpoint, the Royal Navy's experience with main propulsion gas turbines, the

status and prospects of the industrial gas turbine, and the designer's dilemma with unmanned controls and the gas turbine user. Attention is also given to a new maintenance concept applied in the design of a new industrial gas turbine in the 100 MW class, experience with gas turbines in the field by a British petroleum company, gas turbines in a powered distribution system, monitoring for preventive maintenance in the small fleet, gas turbine power for large hovercraft, and the gas turbine in the gas transmission environment G R

**A77-46402** Gas turbine evolution F W Armstrong (National Gas Turbine Establishment, Farnborough, Hants., England) In Gas turbines - Status and prospects, Proceedings of the Symposium, London, England, February 4, 5, 1976 London and New York, Mechanical Engineering Publications, Ltd, 1976, p 1-15 17 refs

The paper discusses the continuing evolution of the gas turbine, and makes a broad assessment of future prospects. The scope for further development of the various facets of gas turbine technology is considered first. The second part of the paper suggests how gas turbine powerplants for aeronautical, marine and land-based applications might evolve as a result of technical, economic and environmental influences (Author)

**A77-46404** Designing gas turbines for the industrial and marine field N L Shorthose (Rolls-Royce /1971/, Ltd, Industrial and Marine Div, Ansty, Warwick, England) In Gas turbines - Status and prospects, Proceedings of the Symposium, London, England, February 4, 5, 1976 London and New York, Mechanical Engineering Publications, Ltd, 1976, p 27-34

Some of the design changes involved in preparing aero engines for industrial and marine use are examined. The aero engine in its new environment is considered, taking into account approaches for protecting compressor component materials against corrosion, the occurrence of dangerous resonance effects in connection with differences concerning the operating regime, turbine-related problems, combustion difficulties, and design changes with respect to accessories and accessory gearboxes. It is found that in the case of certain gas turbines the basic aero form can also be used for an employment as gas producer in industrial applications. For other engines basic configuration changes are required G R

**A77-46408** The industrial gas turbine - Its status and prospects J R Tyler (Ruston Gas Turbines, Ltd, Lincoln, Lincs, England). In Gas turbines - Status and prospects, Proceedings of the Symposium, London, England, February 4, 5, 1976. London and New York, Mechanical Engineering Publications, Ltd, 1976, p 65-74

The paper reviews briefly the history of the gas turbine and the post war emergence of the industrial machine following a separate path from that of the aircraft engine. Because of its characteristics, application has been restricted to three general fields, standby or peaking duty, total energy and the oil and gas industry, of which the last named was the first major user. The environmental factors peculiar to the oil industry combined with the extreme importance of reliability has greatly influenced the design of machinery and systems. This is illustrated by a description of a typical industrial gas turbine and by some examples from operating experience in a wide variety of applications. The accelerated search for gas and oil particularly offshore, is likely to sustain the demand for gas turbines while pressure to conserve existing resources may lead to a greater interest in local power generation using the 'total energy' principle. (Author)

**A77-46410** A new maintenance concept applied in the design of a new industrial gas turbine in the 100 MW class T E Thoren (Stal-Laval Turbin AB, Finspong, Sweden) In Gas turbines - Status and prospects, Proceedings of the Symposium, London, England, February 4, 5, 1976 London and New York, Mechanical Engineering Publications, Ltd., 1976, p 81-90

Second generation industrial gas turbines will have advanced performance data to fit future high fuel costs. Equally important is that availability is high. A durable well analyzed design with provisions for quick repairs should yield the best availability. The

paper describes a new concept in maintainability applied in the design of a new industrial gas turbine in the 100 MW class, developed in cooperation between Stal-Laval and United Technologies. A three-shaft machinery lay-out lends itself to a large degree of modularization. Possibility for quick changeout of modules is a good guarantee for high availability (Author)

**A77-46413** Some observations on the selection of gas turbine generating plant L J Spinks (Preece, Cardew and Rider, Consulting Engineers, Brighton, England) In Gas turbines - Status and prospects, Proceedings of the Symposium, London, England, February 4, 5, 1976 London and New York, Mechanical Engineering Publications, Ltd, 1976, p 147-156.

Observations are made concerning miscellaneous problems associated with the application of gas turbine plant for power generation in medium to large unit sizes. Attention is directed to problems relating to the continued rapid development to higher ratings and to operation and maintenance in developing countries and hostile environments. The paper concludes with a note on future trends (Author)

**A77-46449** Liquid fuels and chemical feedstocks from coal by supercritical gas extraction N Gangoli and G Thodos (Northwestern University, Evanston, Ill) *I & EC - Industrial and Engineering Chemistry, Product Research and Development*, vol 16, Sept. 1977, p 208-216 50 refs

As an alternative source of energy, theoretical arguments and basic experimental evidence of a new separation technique for the extraction of liquid fuel constituents from coal are presented. The technique is based on the solvent capability of compressed gases under supercritical state conditions. Several research investigations regarding the chemical constitution of coal are described and a study of the critical state behavior of various simple and complex mixtures is presented in detail, including the possibility of a liquid phase occurrence. The five basic steps of the new process are outlined. Detailed lists of the advantages of this new technique, and particularly its advantages over the older method of liquid extraction are included. Other applications of the method are briefly surveyed SCS

**A77-46467 #** Morphological analysis as a design aid: An application to solar energy conversion processes (Contribution à l'aide à la conception par l'analyse morphologique. Application à des filières de conversion de l'énergie solaire) P Labat Toulouse III, Université, Docteur (3e cycle) Thesis, 1977. 215 p 43 refs In French

The optical and thermal properties of solar radiation relevant to the design of solar energy flat-plate collectors, as well as the luminance and emissivity characteristics of absorptive agents, are reviewed. Disadvantages of systems using flat-plate collectors without heliostats, including their unsuitability for coupling with efficient thermodynamic cycles, and the energy losses encountered during increases in the temperature of heat-carrying fluids circulating in the systems, are discussed. Properties and possible configurations of systems employing solar concentrators, such as cylindrical parabolic mirrors, are also given. A computer program based on morphological analysis is then developed which takes into account these design parameters to formulate a least costly flat-plate collector system. The sample problem tested has the advantages of involving very brief computing times JMB

**A77-46469 #** An electrooptical model for the design of semiconductor solar cells (Modèle optoélectronique pour la conception de piles solaires à semiconducteur). J-C. Suau Toulouse III, Université, Docteur (3e cycle) Thesis, 1977 180 p. 42 refs. In French

Photovoltaic cells for use in solar energy systems are studied, with the emphasis on increasing cell efficiency in energy conversion. The electrical properties of pn junctions and Schottky barrier diodes are reviewed, and a numerical technique for simulating the performance of solar energy systems using these components is formulated. The quality, stability and cost of thin silicon layers for solar cell applications are discussed, experiments involving silicon deposition onto substrates of various resistivity are conducted, with the aim of studying photocurrent as a function of doping. The absorption and deposition characteristics of other films, such as CdTe layers, are also assessed. It is suggested that a combination of optical concentrators and photovoltaic cells may yield viable energy conversion systems J.M.B

**A77-46550** A large solar heating system for a Saudi campus complex J R Schneider and S F Glover (Sverdrup and Parcel and Associates, Inc., St Louis, Mo.) *Building Systems Design*, vol 74, Aug.-Sept, 1977, p 28-43. 5 refs.

The design program for the world's largest central heating system, designed to provide domestic hot water and building space heating in a campus complex of fourteen buildings, is described. The design heat loads are 36,000 gallons per day of domestic hot water, and a winter time building space heat load which is about the same size as the domestic hot water load on an annual basis. For hot water, 70 F well water is heated to 140 F delivery temperature, for building space heating water, the delivery temperature requirement is 120 F with a return temperature between 90 and 100 F. Data on the standard collector performance are provided, and the heating, storage, and distribution systems are characterized. A unique feature of the system is the stratified storage in a series of three series-connected 45-foot tall upright tanks. Seventy percent of the total heat load is supplied by solar energy - 100% of the hot water load and 40% of the heat load M.L.

**A77-46573** Hydrogen and oxygen from water E A Fletcher (Minnesota, University, Minneapolis, Minn.) and R L Moen *Science*, vol 197, Sept 9, 1977, p 1050-1056. 25 refs.

A preliminary proposal for an idealized model of a one-step, high temperature thermochemical effusional process for producing hydrogen and oxygen from water using solar energy is described. A schematic diagram of the apparatus and its system efficiency are defined along with a simple situation to show the effect of high temperature operation on the system efficiency. Membrane materials, and the design and production are discussed. A series of user-interactive computer experiments is developed to determine the optimum operation variables. It is concluded that the effusional separation of hydrogen and oxygen from water at high temperatures using solar power is possible S.C.S.

**A77-46608** Domestic hot water and solar energy in Ireland. F. Hand, B. Asare, and J. Haslett (Trinity College, Dublin, Ireland). *International Journal of Energy Research*, vol 1, July-Sept, 1977, p 249-257. 11 refs. Research supported by the EEC Energy Research and Development Programme.

The ability of two solar energy systems to supply domestic hot-water requirements in Ireland is studied by means of a computer simulation model of a system which uses a commercially available solar panel. The water-heating systems and the analysis of system performance are described. The model indicates that, for the cost of the systems to be economically justifiable in comparison with the costs of electricity, the water supply must be directly heated by solar panels and the installed cost of the panels must be low. It is thought that the system performance is relatively insensitive to panel orientation so that retrofit installations on existing houses could be feasible. M.L.

**A77-46609** Hydrogen and electricity from water and light. K. Ohashi, J. McCann, and J. O. Bockris (South Australia, Flinders University, Adelaide, Australia). *International Journal of Energy Research*, vol 1, July-Sept. 1977, p. 259-277. 12 refs.

Four self-driven photoelectrochemical hydrogen producers, n-TiO<sub>2</sub>/p-CdTe, n-TiO<sub>2</sub>/p-GaP, n-SrTiO<sub>3</sub>/p-CdTe, and n-SrTiO<sub>3</sub>/p-GaP, were constructed and examined in 1 M NaOH. The current-potential curves of the individual electrodes and the current-cell voltage relationships were measured. Cell current-density measurements versus time demonstrated that the output of each cell is stable for at least 12h. The n-SrTiO<sub>3</sub>/p-GaP cell under xenon light irradiation was the most efficient at 0.7 per cent. The n-TiO<sub>2</sub>/p-GaP cell was estimated as the most efficient under solar light at 0.1 per cent. The stability of p-CdTe and its energy gap of 1.5eV make it a prospect for use as a photocathode in future photoelectrochemical hydrogen producers (Author)

**A77-46627** New themes for space. Mankind's future needs and aspirations, *Proceedings of the Bicentennial Space Symposium*, Washington, D.C., October 6-8, 1976. Symposium sponsored by the American Astronautical Society and American Institute of Aeronautics and Astronautics. Edited by W. C. Schneider (NASA, Washington, D.C.). San Diego, Calif., American Astronautical Society (Advances in the Astronautical Sciences, Volume 35), 1977. 229 p. \$25.

Satellite communications, space manufacturing, remote sensing, and environmental observation are discussed. In the field of satellite communications, the special requirements of a military satellite communication system are explained, the use of satellites for mobile communications service is considered, and public service programs using NASA's ATS-6 and CTS satellites are discussed. Space stations and space manufacturing are examined with attention to equipment design, prospective products, and economic feasibility. Other topics include satellite power stations and the monitoring of crops and forests from space. M.L.

**A77-46633** The space station and space industrialization. R. L. Kline (Grumman Aerospace Corp., Bethpage, N.Y.). In *New themes for space. Mankind's future needs and aspirations, Proceedings of the Bicentennial Space Symposium*, Washington, D.C., October 6-8, 1976. San Diego, Calif., American Astronautical Society, 1977, p. 121-138. 6 refs. (AAS 76-050)

Space station concepts and modules are described, and the goals of the space station program are explained. A sequence of space stations is considered which begins with solar power stations and proceeds to public service stations and then space manufacturing stations. Four concepts for solar power stations are presented, and services that could be provided by a public service station are summarized. A space manufacturing station concept that could be used for the production of high coercive strength magnetic material is examined. Present and future development of the space station program is discussed. M.L.

**A77-46639** Prospects for satellite power stations. R. A. Summers (ERDA, Washington, D.C.). In *New themes for space. Mankind's future needs and aspirations, Proceedings of the Bicentennial Space Symposium*, Washington, D.C., October 6-8, 1976. San Diego, Calif., American Astronautical Society, 1977, p. 209-229. (AAS 76-058)

The solar satellite power station concept is discussed, and current and projected energy use patterns are considered. Advantages and disadvantages of a satellite power project are examined with attention to the technology status and targets, the environmental impacts, the economics and planning implications, and the likely institutional/international problems. Some research goals for the immediate future are suggested. M.L.

**A77-46652** A study of the effects of new transportation systems on urban transportation and environment by computer simulation. H. Tsuchiya, M. Abe (Jizai Engineering, Ltd., Tokyo, Japan), F. Harashima (Tokyo, University, Tokyo, Japan), A. Uehara, M. Ishikawa (Ministry of International Trade and Industry, Tokyo, Japan), and T. Itoh (Japan Automobile Research Institute, Inc., Ibaraki, Japan). In *Control in transportation systems, Proceedings of the Third International Symposium*, Columbus, Ohio, August 9-13,

1976 Helsinki, International Federation of Automatic Control, Pittsburgh, Pa., Instrument Society of America, 1976, p 245-251 5 refs Research supported by the Japan Society for Promotion of Machine Industry and Japan Society of Automotive Engineers

A computer simulation is employed to study the long-range effects of introducing into a city having a population of about one-half million any one or a combination of three transportation systems, including Personal Rapid Transit (PRT), Electric Vehicle and Electronic Route Guidance systems. The city is assumed to have rapid transit and a bus system at the outset. The simulation takes into account the distribution of stations, and uses a mathematical model to determine the modes of travel selected by the projected passengers. Quality of the modified transportation systems is assessed by indices such as average trip time, crowding rate at rush hours, energy consumption and air pollution levels. Results of the simulation indicate that introduction of PRT lessens demands on automobile, bus and rapid transit modes and yields eventual reductions in average trip time and energy consumption J M B

**A77-46722** Porous electrodes for Zn/air alkaline battery I Amato, S Corso, and E Sgambetterra (Fiat S.p.A., Turin, Italy) In Modern developments in powder metallurgy Volume 11 Proceedings of the Fifth International Powder Metallurgy Conference, Chicago, Ill, June 27-July 2, 1976 Princeton, N.J., Metal Powder Industries Federation, American Powder Metallurgy Institute, 1977, p 331-339 6 refs

An investigation has been conducted concerning the development of suitable techniques for the fabrication of dual porosity electrodes for fuel cell applications involving the use of nickel catalysts in an alkaline environment. The double layer electrode employed contains micropores, which are in contact with the electrolyte, and macropores, which are in contact with the gas. A powder metallurgy process for the manufacture of the electrodes has been studied. Attention is given to die pressing and sintering, roll compaction of carbonyl nickel powder, experiments concerning the spray deposition of a slurry suspension, and the reinforcement of the electrodes with the aid of an incorporated wire mesh G R

**A77-46768** Computing residuals in geothermal research by I.R. scanning. A. M. Tonelli (ARCO, Milan, Italy) *British Interplanetary Society, Journal (Remote Sensing)*, vol 30, May 1977, p. 187-192

The thermal phenomena related to the presence of geothermal sources is examined stressing the increase in the local smoothing of temperature variations in time and space due to an increase of thermal inertia, a minimum in the distribution of the normalized gradients, the minimum variation of entropy, and the minimum shift of the thermal baricenters. The smoothing technique involves applications of infra-red scanning to both rectified and non-rectified images. The effect of geothermal heat on thermal inertia is discussed, and a method for its analysis is suggested S C S

**A77-46770** On the realization of projects - With special reference to O'Neill space colonies and the like A V Cleaver *British Interplanetary Society, Journal (Space Colonization)*, vol 30, Aug 1977, p 283-288

A general critique of the O'Neill proposals (1974) for giant space colonies is considered from the standpoints of the feasibility and the probability of the project. It is suggested that such colonies are theoretically feasible as they do not violate any fundamental laws, and require only the refinement of existing technology. The realization of such a proposal is reviewed both in terms of the motivation and costs, evaluating specifically political reasons, personal motivation, practical considerations, inflation, specification, program changes, and the inhibition of an honest estimation. It is concluded that although at present such a project is too expensive, continued study of its long term possibilities is advised as the practical need for the development of solar power stations and/or orbiting space factories may arise S C S

**A77-46771** A preliminary cost benefit analysis of space colonization. M M Hopkins (Harvard University, Cambridge, Mass.) *British Interplanetary Society, Journal (Space Colonization)*, vol 30, Aug 1977, p 289-300 16 refs

The economic results of the NASA-Ames-Stanford ASEE 1975 Summer Study of Space Colonization are presented. The system of space colonization is considered in general terms as to its set-up, economic viability, the steps in its construction, and the consumer benefits posited. The proposed production schedule for the space colonies and the space shuttle is reviewed. An estimation of the cash flow based on a yearly review is discussed along with suggestions for alternate pricing schemes, such as the possibility of appealing to a foreign market, other ways of obtaining electrical power, and the possibilities for space industrialization. Benefits relating to environmental concerns, satellite functioning, and space manufacturing are discussed. The article is concluded with four detailed appendices which treat the production schedule and related costs, price considerations, variables dependent on subsequent colonies, and the environmental impact of microwave power transmission S C S

**A77-46775** Powersats - An economic assessment H O Ruppe (Munchen, Technische Universität, Munich, West Germany) *British Interplanetary Society, Journal (Space Colonization)*, vol 30, Aug 1977, p 317-320 6 refs

The economic feasibility of Powersats (satellite solar power stations) is discussed. Problems such as a conversion system of solar to electric power at the scale needed, microwave power transmission, and high voltage space traffic show that technological feasibility has not yet been demonstrated. However, the advantages, such as the availability of primary energy, and the freedom from chemical and nuclear pollutants call for an economic analysis. A development schedule consisting of three phases is outlined: 1) bringing the carrier system into initial operating capability, 2) developing the first Powersat, 3) beginning its operation. Details of the costing are reviewed and it is concluded that both technical feasibility and economic vitality are doubtful, and that the long realization period and the requirement for tremendous capital outlay make the project impractical S C S

**A77-46783 #** Rechargeable batteries in Japan. Edited by Y Miyake (Government Industrial Research Institute, Osaka, Japan) and A Kozawa (Union Carbide Parma Technical Center, Cleveland, Ohio) Cleveland, JEC Press, Inc., 1977 521 p. \$43

The history and the present status of technology of the Japanese lead-acid battery industry is examined and various developments related to lead-acid batteries are considered, taking into account high performance automobile lead acid batteries, dry charged lead-acid batteries for automobile applications, glass fiber tubular type industrial batteries, sealed lead acid stationary batteries with catalyst plug, auxiliary electrode gas recombination sealed stationary lead-acid batteries, and small sealed lead acid batteries with gelled electrolyte. Attention is also given to nickel-cadmium batteries, silver zinc rechargeable batteries, catalyst plug devices for storage batteries, and lead acid batteries for a use in electric vehicles G R

**A77-46786** The consumer's electric car. E H Wakefield Ann Arbor, Mich., Ann Arbor Science Publishers, Inc., 1977 145 p 26 refs \$9.95

Problems in the design and maintenance of electric vehicles for use in personal transportation are discussed. A study of driving habits in the U.S., which indicates that 50% of gasoline-powered cars travel less than 28 miles per day, and that 54% of the trips are under 5 miles, is used to illustrate the viability of low- and medium-range high-efficiency electric cars. Government regulation, power requirements, energy consumption and the economics of electric vehicles are also considered. Electrical specifications and means of measuring the efficiencies of electric cars are given, in particular, series-wound dc motors, shunt wound motors, and cumulative compound-wound dc motors are described. Maintenance of the motors and suggestions for improving road performance of electric vehicles are listed for reference. Novel electric vehicle power sources, such as those involving solar energy, are also mentioned J M B

**A77-46787** Space and energy, Proceedings of the Twenty-sixth International Astronautical Congress, Lisbon, Portugal, September 21-27, 1975. Congress sponsored by the International Astronautical Federation Edited by L. G. Napolitano (Napoli, Università, Naples, Italy) Oxford and New York, Pergamon Press, 1977 495 p \$50

The papers deal with recent developments in space technology, astronautics, astrodynamics, and bioastronautics. The main subject areas are the utilization of solar energy and of energy generated in space, engineering and life sciences, space systems and technology, and applications satellites. Specific topics include solar energy systems, the Spacelab electric power system, gaseous-core reactors and nuclear-pumped lasers for space power generation and transmission, the construction of satellite solar power stations in space, qualitative techniques in celestial mechanics, the possible use of interplanetary orbits as a gravitational-wave detector, the attitude stabilization system and solar array of the Communications Technology Satellite, the contribution of biological satellites to space medicine, and atmosphere revitalization aboard Spacelab. Other contributions discuss propulsion system concepts for single-stage space shuttles, reliability design criteria for the Mariner Jupiter/Saturn spacecraft, the development of an experimental hybrid rocket, the Large Space Telescope, a mission design for a 1980 Pioneer Jupiter orbiter, progress and trends in commercial satellite communications, the Marisat system, side-looking radar systems for Spacelab, and basic concepts of a complete multiband photographic system for remote-sensing applications. F G M

**A77-46788** Earth, an open system - The use of solar energy. A. L. Jaumotte (Bruxelles, Université Libre, Brussels, Belgium) In Space and energy, Proceedings of the Twenty-sixth International Astronautical Congress, Lisbon, Portugal, September 21-27, 1975. Oxford and New York, Pergamon Press, 1977, p 3-27 45 refs

The article provides a survey of the possible utilizations of solar energy, both in terms of immediate targets and long range goals. Two applications of low-temperature thermal energy are described: the heating and cooling of solar dwellings, and the solar irrigation pump. Possible improvements for agricultural science applying solar energy to photosynthesis are suggested. Recommendations for combining solar energy with optical concentrations are presented, such as the development of heliostats, and long range prospects for Satellite Solar Power Stations (SSPS). The article concludes with a few notes on pollution caused by solar energy, and the contribution of such research to space technology. S C S

**A77-46789** The electrical power system for Spacelab. B. Gohrbandt and E. F. Schmidt (Telefunken AG, Hamburg, West Germany) In Space and energy, Proceedings of the Twenty-sixth International Astronautical Congress, Lisbon, Portugal, September 21-27, 1975. Oxford and New York, Pergamon Press, 1977, p 29-43

Following an overview of the Spacelab's mission requirements, such as its general weight, power consumption, and heat dissipation, the Electrical Power and Distribution Subsystem (EPDS) is described in full with subsystem design requirements and primary design criteria listed. A block diagram of the EPDS is shown and separate presentations are made for the following features: (1) the power conditioning and distribution concepts, (2) power sources, (3) power conditioning equipment, (4) power distribution, monitoring and protection, (5) the emergency power system, (6) the lighting system, and (7) signal conditioning. It is concluded that the EPDS provides the flexibility necessary for various payloads and configurations of the Spacelab mission. S C S

**A77-46878** # A space station for the 1980's - A look at the next generation of operational systems and their functional requirements. R. J. Gunkel and H. L. Wolbers (McDonnell Douglas Astronautics Co., Huntington Beach, Calif.). ASME, SAE, AIAA, ASMA, and AICHE, Intersociety Conference on Environmental Systems, 7th, San Francisco, Calif., July 11-14, 1977, ASME Paper 77-ENAS-37 9 p 5 refs. Members, \$1 50, nonmembers, \$3 00.

Potential applications and requirements proposed to increase the efficiency and effectiveness of future continuously manned space stations are described. Three examples are discussed: space processing, earth services, and satellite power systems. The implementation procedures for the development of such space systems are outlined along with a proposed construction schedule and the critical factors to be considered in future planning activities are reviewed. The key technology needs for future environmental systems are described including technology for space processing, extravehicular activity, fabrication and assembly techniques, interaction with the space environment, electrical power systems, and long-duration environmental control and life support systems. S C S

**A77-46885** \* # Space construction base support requirements for environmental control and life support systems. R. J. Thiele, T. C. Secord, and G. L. Murphy (McDonnell Douglas Astronautics Co., Huntington Beach, Calif.). ASME, SAE, AIAA, ASMA, and AICHE, Intersociety Conference on Environmental Systems, 7th, San Francisco, Calif., July 11-14, 1977, ASME Paper 77-ENAS-44 10 p 11 refs. Members, \$1 50, nonmembers, \$3 00. Contract No. NAS9-14958.

A Space Station analysis study is being performed for NASA which identifies cost-effective Space Station options that can provide a space facility capable of performing space construction, space manufacturing, cosmological research, earth services, and other functions. A space construction base concept for the construction of large structures, such as those needed to implement satellite solar power for earth usage, will be used as a basis for discussing requirements that impact the design selection, level of integration, and operation of environmental control and life support systems (ECLSS). The space construction base configuration also provides a basic Space Station facility that can accommodate biological manufacturing modules, ultrapure glasses manufacturing modules, and modules for other services in a building-block fashion. Examples of special problems that could dictate hardware required to augment the basic ECLSS for autonomous modules will be highlighted. Additionally, overall intravehicular (IVA) and extravehicular (EVA) activities and requirements that could impact the basic station ECLSS degree of closure are discussed. (Author)

**A77-46890** # Waste resources - Problems and promise. D. K. Walter (ERDA, Urban Waste Technology Branch, Washington, D C). ASME, SAE, AIAA, ASMA, and AICHE, Intersociety Conference on Environmental Systems, 7th, San Francisco, Calif., July 11-14, 1977, ASME Paper 77-ENAS-49 8 p. Members, \$1 50, nonmembers, \$3 00.

Communication problems concerning the meaning of the term 'efficiency' are examined and efficiency calculations conducted according to seven different computational concepts are considered. Attention is given to the costs of a typical landfill operation, an energy and material system, the energy from waste technology, options concerning waste utilization, waste sources, and the ERDA research and development program for energy-from-wastes systems. Major factors in favor of commercializing urban waste to energy processes are discussed. G. R.

**A77-46909** # Design of a low cost space heating system using warm geothermal or industrial effluents. A. J. Pate and J. C. Batty (Utah State University, Logan, Utah). American Society of Mechanical Engineers, Design Engineering Conference and Show, Chicago, Ill., May 9-12, 1977, Paper 77-DE-26. 8 p 37 refs. Members, \$1 50, nonmembers, \$3 00.

The design of an effective heating system employing moderate temperature (100 to 150 F) geothermal waters to heat greenhouses without any backup conventional system is discussed. The use of nonspecialized materials is emphasized with the result that maintenance is simple, fast, and requires no skilled labor. The heat exchanger system development starts with conventional methods and evolves, through heat transfer analysis and a series of simplifications, to a versatile system which tends to maintain a more stable temperature in the greenhouse than conventional greenhouse heating systems. Problems encountered in using geothermal brines are

reported, and inexpensive solutions to these problems are suggested. The complete design is also outlined, with consideration given to heat transfer calculations as well as economic factors. A model of the system was constructed and tested for use as a retrieval system for energy in industrial thermal effluents as well as in geothermal waters. (Author)

**A77-46959 #** Quasi-analog models of large systems of algebraic equations (Kvazianalogovye modeli bol'shikh sistem algebraicheskikh uravnenii) M N Kulik, V D Bakumenko, A Aminov, and V N Chumakov (Akademiia Nauk Ukrainsoi SSR, Institut Elektrodinamiki, Kiev, Ukrainian SSR) *Matematicheskoe Modelirovanie i Teoriia Elektricheskikh Tsepei*, no 15, 1977, p. 34-41 5 refs In Russian

The paper presents a matrix two-component dc modeling circuit for solving systems of linear algebraic equations which is highly stable for an arbitrary nonsingular matrix of the coefficients of the system to be solved. Results of tests of the dynamic characteristics of the circuit show that it is fit for use as an electric network model in computers for calculating energy system operations. P T H

**A77-47174** Power with heliostats A F Hildebrandt and L L Vant-Hull (Houston, University, Houston, Tex) *Science*, vol 197, Sept 1977, p 1139-1146 18 refs Research supported by the University of Houston, NSF Grants No GI-39456, No AER-73-07950-A03, Grant No EG-76-05-5178, Contract No E(04-3)-1108

A proposal for the use of heliostats as a means to produce solar energy in quantities great enough to power the electric and gas utilities, i.e., with high-quality heat of at least 300 C and where individual units produce approximately 100 MW of electricity, is outlined. The plan of the solar thermal power system is discussed in detail including variations in its construction for specific needs. Specifically, the design of the heliostat field, the receiver, tower, and storage facilities are considered. The environmental concerns of such plants are reviewed, as are questions regarding cost planning and reduction. It is concluded that although the cost of producing solar power plants is similar to that of other means of energy production, solar energy production will become increasingly more important in terms of long range economic and political plans. S C S

**A77-47201 #** Microwave radiometry of land and water areas on the earth surface from onboard aircraft laboratories (SVCh-radiometricheskoe issledovanie zemnykh pokrovov i akvatorii s borta samoletov-laboratorii) L F Borodin, A A Kurskaia, and A M Shutko In Space studies of earth resources. Methods and means of measurement and data processing. Moscow, Izdatel'stvo Nauka, 1976, p 290-296 In Russian

The following geophysical uses of aerial microwave radiometry are considered: determination of sea states and temperatures, studies of soil moisture, detection of regions of geothermal activity, forest fire mapping, sea and land ice reporting, and determination of soil density gradients. Attention is given to specific recordings of radio thermal emission signals and radio brightness data in the spectral range 0.8-30 cm. B.J

**A77-47210** Energy from solid waste utilization; Proceedings of the Sixth Annual Northeastern Regional Antipollution

Conference on a New Source of Materials, Energy and Jobs - Solid Wastes Processing, University of Rhode Island, Kingston, R.I., July 8, 9, 1975. Edited by S M Barnett, D Sussman, and C J Wilson. Westport, Conn, Technomic Publishing Co, Inc, 1976 422 p. \$35

Papers are presented on the shredding of municipal solid wastes and the potential markets for recovered products, including the recycling of ferrous metals, the economics of separate refuse collection, and industrial development based on resources recovery. A solid waste management planning model is discussed along with risk management and an approach to material equilibrium. Several processes for energy and resources recovery are outlined, such as fuel derivatives from municipal solid wastes, the Ames, Iowa, project for power generation; fluidized-bed incineration of waste materials, and the Selectomatic Commest solid waste system. Alternative processes for solid waste utilization are suggested, including methane production, a refuse-derived fuel, incineration, recycling, and steam recovery. S C S

**A77-47211** Economics of solid waste conversion. H A Gorges (Tractor Jitco, Inc, Rockville, Md) In Energy from solid waste utilization, Proceedings of the Sixth Annual Northeastern Regional Antipollution Conference on a New Source of Materials, Energy and Jobs - Solid Wastes Processing, Kingston, R I, July 8, 9, 1975. Westport, Conn, Technomic Publishing Co, Inc, 1976, p 81-94

A method is developed to evaluate the economic viability of a solid waste recovery and conversion system. Variables are considered such as predicting industrial and demographic conditions, calculating environmental impact, and institutional constraints. The parameters used to determine the plant's performance are identified, and a procedure is suggested for regulating the cash flow cycle through the system, including (1) cost assessment, (2) a break-even method to establish a measure for the sales value of the energy produced (the ratio of the price of the heat value sold to the equivalent cost of crude oil in dollars/barrels), (3) evaluation of the price structure in a competitive market, (4) establishing economic guidelines, and (5) determining the constraints and bounds of the system. S C S

**A77-47213** Potential alternative fuel derivatives from municipal solid wastes. J F Schnelle, Jr (Combustion Engineering, Inc, Providence, R I) and J H Yamamoto In Energy from solid waste utilization, Proceedings of the Sixth Annual Northeastern Regional Antipollution Conference on a New Source of Materials, Energy and Jobs - Solid Wastes Processing, Kingston, R I, July 8, 9, 1975. Westport, Conn, Technomic Publishing Co., Inc., 1976, p 167-208.

Various methods of using shredded solid waste as a supplementary fuel source are discussed, specifically (1) heat recovery based on a waterwall incinerator, (2) solid refuse fuel recovery by either dry-shedding or wet-pulping techniques, and (3) chemical and biochemical conversion by several pyrolysis processes for the production of gas and oil. The methods are compared with respect to capital and operating costs as well as output streams. It is concluded that fuel recovery is the most economically promising resource recovery process, with material recovery, pyrolysis, and composting being more expensive alternatives. The advantages and disadvantages of energy recovery are summarized. S C S

**A77-47214** A supplementary fuel for power generation /Ames, Iowa/ H Funk (Henningson, Durham and Richardson, Omaha, Neb) and R Sheahan (Henningson, Durham and Richardson, Washington, D C) In Energy from solid waste utilization, Proceedings of the Sixth Annual Northeastern Regional Antipollution Conference on a New Source of Materials, Energy and Jobs - Solid Wastes Processing, Kingston, R.I., July 8, 9, 1975. Westport, Conn, Technomic Publishing Co, Inc., 1976, p 209-220

A summary is presented of the technical and economic aspects of a solid waste recovery system in Ames, Iowa, which studied the

feasibility of burning the combustible part of the solid waste as supplemental fuel. The quantities and characteristics of the solid waste are discussed along with the major mechanical components of the processing facility (receiving area, primary shredding, air density classifier, combustibles separation, etc.), and the estimated costs and revenues (capital costs, operating costs, etc.). It was concluded that the basic principle of supplementary refuse fuel firing could be applied successfully to the Ames power plant SCS

**A77-47215** Energy and resource recovery from solid wastes. G. M. Mallan and E. I. Titlow (Garrett Research and Development Co., Inc., La Verne, Calif.). In: Energy from solid waste utilization, Proceedings of the Sixth Annual Northeastern Regional Antipollution Conference on a New Source of Materials, Energy and Jobs - Solid Wastes Processing, Kingston, R.I., July 8, 9, 1975. Westport, Conn., Technomic Publishing Co., Inc., 1976, p. 221-250.

A method is described for the conversion of the organic portion of municipal solid waste into useable fuel and for the recovery of valuable metals and glass. The steps of the process include (1) primary shredding, (2) magnetic separation of ferrous metals, (3) air classification, (4) drying of shredded refuse, (5) screening of dry material, (6) aluminum recovery, (7) secondary shredding, (8) flash pyrolysis, and (9) collection of pyrolytic products. The major processes are described in full, including feed preparation, glass recovery, aluminum recovery, and pyrolysis. The recovered products are discussed along with a review of the project economics as well as a projected installation procedure for Bridgeport, Connecticut SCS

**A77-47216** Fluidized-bed incineration of waste materials. J. E. Hanway, Jr. (Beamer/Wilkinson and Associates, Oakland, Calif.). In: Energy from solid waste utilization, Proceedings of the Sixth Annual Northeastern Regional Antipollution Conference on a New Source of Materials, Energy and Jobs - Solid Wastes Processing, Kingston, R.I., July 8, 9, 1975. Westport, Conn., Technomic Publishing Co., Inc., 1976, p. 261-279.

Fluidized-bed incineration of municipal solid wastes is described in terms of technical considerations, possible applications, and economics. Specific attention is given to the hardware, temperature parameters, methods of heat recovery, and treatment of exhaust gases. Among the possible applications are the incineration of municipal sludge, solid refuse, and coal combustion. The method's economics are computed for capital, operational, and net costs, and it is concluded that fluidized-bed incineration is a simple, reliable, and economical method which permits adaptability to the treatment of almost any type of waste that can be thermally oxidized or incinerated, and also provides the capability to tolerate a wide range of operating conditions SCS.

In: Energy from solid waste utilization, Proceedings of the Sixth Annual Northeastern Regional Antipollution Conference on a New Source of Materials, Energy and Jobs - Solid Wastes Processing, Kingston, R.I., July 8, 9, 1975. Westport, Conn., Technomic Publishing Co., Inc., 1976, p. 315-332. 21 refs. NSF Grant No. C-827.

The process description for the anaerobic production of methane from solid waste consists of (1) feed preparation, (2) digestion, (3) gas treatment and handling, and (4) effluent disposal. An economic analysis of the procedure develops a computer model, reviews the system advantages and disadvantages, and calculates the cost of gas and of methane at baseline conditions. A sensitivity study and a forecast of the potential impact of the system are reviewed along with an evaluation of the process design, economics, and future plans. It is concluded that waste-produced methane may have a significant impact as a supplemental source of pipeline-quality gas and that anaerobic digestion of the organic portion of municipal refuse is currently the only known process for energy recovery in this form SCS

**A77-47220** Modern incineration - A proven way for recovery of energy and metals. C. A. Rogus. In: Energy from solid waste utilization, Proceedings of the Sixth Annual Northeastern Regional Antipollution Conference on a New Source of Materials, Energy and Jobs - Solid Wastes Processing, Kingston, R.I., July 8, 9, 1975. Westport, Conn., Technomic Publishing Co., Inc., 1976, p. 351-357.

**A77-47222** Steam recovery - An alternative for intermediate size regions. R. H. Stephens (Arthur D. Little, Inc., Cambridge, Mass.). In: Energy from solid waste utilization, Proceedings of the Sixth Annual Northeastern Regional Antipollution Conference on a New Source of Materials, Energy and Jobs - Solid Wastes Processing, Kingston, R.I., July 8, 9, 1975. Westport, Conn., Technomic Publishing Co., Inc., 1976, p. 387-418.

Regional planning for solid waste disposal is examined with particular reference to a group of Massachusetts towns. Alternatives, such as incineration, steam recovery, and resource recovery, are discussed and evaluated in terms of efficiency, costs, environmental impact (air pollution, ground water pollution, land use), and social impact (inflationary effects, employment benefits). It was concluded that for the particular region considered, both sanitary landfill and steam recovery were acceptable disposal techniques and were comparable in total direct operating costs. Sanitary landfill is a low capital investment with minor environmental impact, whereas steam recovery requires more capital investment, but supports local industry by supplying low-cost energy SCS

**A77-47271 #** The military utility of very large airplanes and alternative fuels. W. T. Mikolowsky (Rand Corp., Washington, D.C.), L. W. Noggle (USAF, Aeronautical Systems Div., Wright-Patterson AFB, Ohio), and W. L. Stanley (Rand Corp., Santa Monica, Calif.). *Astronautics and Aeronautics*, vol. 15, Sept. 1977, p. 46-56. 21 refs.

The paper describes a study with the objectives of evaluating very large airplanes (VLA's) in the context of existing and possible future Air Force missions and determining the most attractive alternative fuel for these airplanes. The chemical fuel alternatives considered are liquid hydrogen, liquid methane, and synthetic JP, each of which can be readily synthesized from coal. The nuclear-fueled VLA was a fourth candidate aircraft. The cost and energy effectiveness of these basic aircraft-fuel combinations in typical range, radius, and station-keeping missions was estimated. It was concluded that overall, a conventional hydrocarbon jet fuel remains the most attractive fuel for military aircraft. Nuclear propulsion is attractive only for station-keeping missions requiring large station radius. VLA's are especially attractive if the capability to airlift US forces world-wide without reliance on overseas bases is a major requirement PTH

**A77-47331 #** Idealization of complex dynamic systems with examples involving electrical energy systems (Idealizatsiia slozhnykh dinamicheskikh sistem s primerami iz elektroenergetiki). N. A. Kartvelishvili and Iu. I. Galaktionov. Moscow, Izdatel'stvo Nauka, 1976. 272 p. 32 refs. In Russian.

The work examines several ways to simplify dynamic systems of high dimensionality, thus making them observable and computable. The techniques of simplification include (1) the division of systems into fast, normal, and slow, (2) the replacement of lumped parameters by distributed parameters using a special critical transition, and (3) the averaging of the motion of a distributed parameter system with respect to spatial coordinates, thus replacing the three-dimensional system by two- or one-dimensional systems. Attention is given to the study of linear systems by the small parameter method and to the continuous idealization of dynamic systems. An electrical energy system is discussed as a classical example of a complex dynamic system B J

**A77-47347 #** Development of a small, low cost turbojet engine with thrust augmentation. W. C. Elrod, H. E. Wright, B. L. Wolfe, Jr., J. D. Durniak (USAF, Institute of Technology, Wright

Patterson AFB, Ohio), and D. B. Wilkinson (USAF, Aero-Propulsion Laboratory, Wright Patterson AFB, Ohio) In *The RPV - Complement to manned systems*, Proceedings of the Fourth Annual Symposium, Washington, D. C., June 5-9, 1977  
Dayton, Ohio, National Association for Remotely Piloted Vehicles, 1977, p. 89-95 7 refs

Turbosuperchargers from two manufacturers were successfully converted to turbojet engines, with engine run up from idle to maximum thrust while limiting the turbine inlet temperature to 1250 K. The smaller of the two turbosupercharge systems selected for conversion (designated J-1 and J-3 engines) was the first to be converted to a turbojet engine (the J-1 unit) and subsequently the conventional combustor was replaced with a catalytic reactor (then designated the J-3 unit). The J-3 engine weighed 13.15 kg (29 lb-m) excluding the oil system and produced 133N (30 lb-f) thrust with a turbine inlet temperature of 1250 K while operating on hydrogen as a fuel. The larger turbosupercharger designated the J-2 unit operating with JP-4 as a fuel and limiting the turbine inlet temperature to 1250 K produced 330 N (74.5 lb-f) thrust dry and 483 N (109 lb-f) with afterburner. The thrust specific fuel consumption ranged from 2.2 to 3.6 (Author)

**A77-47355** Symposium on Clean Fusion, 1st, Washington, D. C., April 30, 1976, Proceedings. Symposium sponsored by the Fusion Energy Corp. Edited by B. C. Maglich (Fusion Energy Corp., Princeton, N.J.) *Nuclear Instruments and Methods*, vol. 144, July-Aug 1977 91 p

Problems associated with the generation of electric power from advanced-fuel fusion reactors are discussed. Clean fusion processes which avoid the production of radioactive materials are reviewed, and various fuel fusions, such as those involving deuterium-fuel Tokamak reactors or laser plasma compression are described. The Migma prototype reactor systems, which rely on ion collision to achieve controlled fusion, are emphasized. In particular, difficulties involved in controlling the velocities and energy distributions of electrons used in neutralizing the ions of a Migma reactor are treated, and a generalized efficiency criterion for fusion reactors is developed to supplant Lawson's Criterion. The integration of fuel fusion plants into existing electric power distribution and transmission networks is also discussed J. M. B.

**A77-47356** Clean fusion concepts and efforts - A survey. R. W. B. Best (EURATOM and Stichting voor Fundamenteel Onderzoek der Materie, Instituut voor Plasmafysica, Jutphaas, Netherlands) (*Fusion Energy Corp., Symposium on Clean Fusion, 1st, Washington, D. C., Apr 30, 1976*) *Nuclear Instruments and Methods*, vol. 144, July-Aug 1977, p. 1-7 24 refs. Research supported by the Nederlandse Organisatie voor Zuiver-Wetenschappelijk Onderzoek and EURATOM.

Fusion reactors as presently conceived are breeders of tritium and, possibly, plutonium as well, a single reactor produces hundreds of tons of radioactive waste per year. Comparatively clean fusion fuels which avoid the production of radioactive matter are reviewed, together with the physical concepts how these fuels can be burnt. The main problems are bremsstrahlung and ion cooling in the presence of electrons, and low power density in the absence of electrons. Laser compression of pellets of a mixture of protons and boron 11 may be a solution when lasers in the megajoule range become available. Other valuable research and development efforts are clamped beam-plasma devices, the Migma cell, and direct converters (Author)

**A77-47357** Studies of deuterium-fueled Tokamak reactors. G. H. Miley, F. H. Southworth, G. Gerdin, and C. Choi (Illinois, University, Urbana, Ill.) (*Fusion Energy Corp., Symposium on Clean Fusion, 1st, Washington, D. C., Apr 30, 1976*) *Nuclear Instruments and Methods*, vol. 144, July-Aug 1977, p. 9-16 22 refs. Research supported by the Electric Power Research Institute.

The importance of using non deuterium-tritium (D-T) fusion fuels is reviewed. Deuterium-deuterium (D-D) operation where product He-3 and tritium are burned at the same rate as produced

(called 'catalyzed-D') is identified as the only advanced fuel that avoids breeding of fuels and yet potentially offers operation under conditions achievable by present magnetic confinement devices. The conceptual design of a Tokamak reactor using catalyzed-D indicates a relatively large reactor, but this could still be quite attractive due to potential improvements in efficiency, reduced radioactivity inventory, and increased first-wall lifetime. While a number of uncertainties remain, the feasibility of such a reactor does not appear to be too great an extension beyond D-T reactors. Although fuels involving heavier elements could offer further advantages by essentially eliminating neutrons and tritium, suitable methods of confining and burning them require a much larger extrapolation of current experience (Author)

**A77-47358** Advanced fuel nuclear reaction feasibility using laser compression. I. H. Hora (New South Wales, University, Kensington, Australia) (*Fusion Energy Corp., Symposium on Clean Fusion, 1st, Washington, D. C., Apr 30, 1976*) *Nuclear Instruments and Methods*, vol. 144, July-Aug 1977, p. 17-25 53 refs. Australian Research Grants Committee Grant No. B75/15538.

While the most advanced concept of magnetic field confinement, the Tokamak, may never be used for advanced clean fuel reactions with HB-11 or similar nuclei because of high loss cyclotron radiation and the high laser energies required, one possible design (besides the Migma type) is the utilization of laser plasma compression resulting from the nonlinear forces of laser-plasma interaction. The much higher efficiency of transferring laser energy into kinetic energy of thick moving plasma layers at low losses due to thermalization, involves laser energies of megajoules (or less when reheat is taken into account) for HB-11 reaching reaction gains of 80. The possibility of ideally adiabatic compression of the plasma is described and the different origins of nonlinear forces by dielectric swelling or by a new mechanism of short-range relativistic self-focusing are explained (Author)

**A77-47359** Advanced fuel nuclear reaction feasibility using laser compression. II. R. Castillo, I. H. Hora, E. L. Kane, V. F. Lawrence, M. B. Nicholson-Florence, M. M. Novak, P. S. Ray, J. R. Shepanski, R. I. Sutherland, and A. I. Tsivinsky (New South Wales, University, Kensington, Australia) (*Fusion Energy Corp., Symposium on Clean Fusion, 1st, Washington, D. C., Apr 30, 1976*) *Nuclear Instruments and Methods*, vol. 144, July-Aug 1977, p. 27-48 48 refs. Australian Research Grants Committee Grant No. B75/15538.

Several problems are considered in studying the properties of the nonlinear-force compression of plasmas by lasers used to reach conditions for advanced clean-fuel nuclear reactions as well as to distinguish from gas-dynamic compression. The propagation of light in inhomogeneous media is based on a simpler, computationally economic program. The Goos-Haenchen effect (1947) is used for discussions of wave propagation and a laser amplifier without superradiance is designed. Corrections for alpha reheat are derived and a very short-range relativistic self-focusing with relatively low thresholds is discussed. Entropy production and electron-radiation interaction are treated relativistically (Author)

**A77-47360** The 1976 status of the Migma program of controlled fusion. B. C. Maglich (Fusion Energy Corp., Princeton, N.J.) (*Fusion Energy Corp., Symposium on Clean Fusion, 1st, Washington, D. C., Apr 30, 1976*) *Nuclear Instruments and Methods*, vol. 144, July-Aug 1977, p. 33-42.

The Migma fusion reactor design, which aims at achieving controlled fusion in intersecting ion orbits, is discussed, with emphasis on techniques used to eliminate random particle motions and Maxwellian distributions of the electrons employed in increasing ion density. Plasma density and confinement times attained for previous designs of the Migma type are reviewed, in particular, confinement times of 2 sec have been reported. The flux lines of the Migma magnetic field, which may be considered a focusing mirror, are described, and suppression of end losses, multiple Coulomb scattering and charge transfer are considered. Factors controlling the distribution of electron velocities are also mentioned J. M. B.

**A77-47361** Impact of advanced fuel fusion on electric power transmission R W de Mello, N Dag Reppen, R J. Ringlee, and D D Wilson (Power Technologies, Inc., Schenectady, N Y) (*Fusion Energy Corp., Symposium on Clean Fusion, 1st, Washington, D C., Apr 30, 1976*) *Nuclear Instruments and Methods*, vol 144, July-Aug 1977, p 43-48 13 refs

The problems of integrating fuel fusion plants into electric power production and distribution systems are discussed Siting and transmission-line requirements for advanced fuel fusion plants are analyzed with reference to the plant-site selection procedures and transmission costs associated with nuclear fission light-water reactor (LWR) plants and coal-fired fossil-steam plants Difficulties related to fusion techniques that involve direct conversion to d c power, such as the need for additional reactor instrumentation and the control of voltage waveforms, are also considered It is suggested that direct-conversion fusion-steam plants could be located in urban areas to reduce transmission costs J M B

**A77-47362** Advanced fuel fusion experimentation with Migmaccells II and III - Orbit diagnostics and lifetime measurements S C Menasian, J Ferrer, B C Maglich, M G Mazarakis, J E. Nering, C Powell, J Sandberg, and A R Whittemore (Fusion Energy Corp., Princeton, N J) (*Fusion Energy Corp., Symposium on Clean Fusion, 1st, Washington, D C., Apr 30, 1976*) *Nuclear Instruments and Methods*, vol 144, July-Aug 1977, p 49, 50

Using both destructive and nondestructive diagnostic techniques, the number of stored ions, the distribution of ions among single particle orbits, the confinement times for stored particles and the fraction of molecular deuterium (+) ions dissociated during the first passage through the Migmaccell are determined Results from Migmaccell II experiments show lifetimes of 10 ms for ten to the 9th power stored deuterons at a background pressure of 4 to the negative 7th power torr air Migmaccell III experiments to date have demonstrated confinement times of 2 s in an unbaked ultra-high vacuum system The number of stored particles observed to date is in excess of ten to the tenth power Migmaccell III particle distributions are strongly peaked at the center of the cell, indicating a significant amount of beam-Migma dissociation (Author)

**A77-47363** Fusion products detection system in Migmaccell II J C Ferrer, B C Maglich, M G Mazarakis, S C Menasian, J E Nering, C W Powell, and A R Whittemore (Fusion Energy Corp., Princeton, N J) (*Fusion Energy Corp., Symposium on Clean Fusion, 1st, Washington, D C., Apr 30, 1976*) *Nuclear Instruments and Methods*, vol 144, July-Aug 1977, p 51-56

To observe the proton-triton branch of the deuterium-deuteron and deuterium-deuteron fusion reaction at an energy of 0.55 MeV in Migmaccell II, three 50-mm square Si surface barrier detectors were installed at 120 deg, -60 deg and -90 deg relative to the incoming deuterium(+) beam Results of an experiment where the background deuterium gas pressure was controlled at around 1.2 times 10 to the negative 5th power torr are presented A computer simulation program has been developed to understand the shapes of the observed spectra Proton counting rates obtained yield a Migma number of 600 million trapped ions in the cell (Author)

**A77-47364** Methods of 'tailoring' ion distributions in phase space /morphodynamics/ S R Channon (Fusion Energy Corp., Princeton, N J) (*Fusion Energy Corp., Symposium on Clean Fusion, 1st, Washington, D C., Apr 30, 1976*) *Nuclear Instruments and Methods*, vol 144, July-Aug 1977, p 57-62.

The control of ion distributions in Migma-type fusion reactors is considered, with the aim of forestalling instabilities and maximizing fusion rate relative to energy losses A description of the ion distribution which reduces the degrees of freedom dealt with and allows for a ready analysis of angular momentum and axial amplitude in terms of energy is given The use of an oscillating electron space charge for shaping the ion distribution is discussed, and the problems associated with characterizing ion orbits during electron oscillations are also treated In particular, use of an orbital model topologically equivalent to the actual orbit is suggested as a means of circumventing the lengthy process of ensemble-averaging J M B.

**A77-47366** Conditions for a boron fusion reactor in the MeV range J R Treglio (Fusion Energy Corp., Princeton, N J) (*Fusion Energy Corp., Symposium on Clean Fusion, 1st, Washington, D C., Apr 30, 1976*) *Nuclear Instruments and Methods*, vol 144, July-Aug 1977, p 65-68. 5 refs

The use of a Migmaccell fusion device in the propulsion of manned spacecraft is discussed The advantage of Migmaccells serving as combined energy plants and ion thrusters (termed 'Migma direct ejection systems') include low mass-to-power ratios, high d.c. outputs, and the absence of neutron production Components of a fuel fusion Migmaccell applicable to spacecraft are described, and mass estimates for the required vacuum chamber, particle accelerator, energy storage system and cryogenic refrigeration system are given Typical missions to Mars and Pluto are considered in a comparison of fission electric and Migma direct ejection systems, the Migma direct ejection method is shown to involve lower fuel consumption and shorter flight times J M B

**A77-47368** Generalized criterion for controlled fusion. R. A. Miller (Fusion Energy Corp., Princeton, N.J.) (*Fusion Energy Corp., Symposium on Clean Fusion, 1st, Washington, D.C., Apr. 30, 1976*) *Nuclear Instruments and Methods*, vol 144, July-Aug. 1977, p 73-76

The modification of Lawson's Criterion for characterizing the feasibility of energy production in a fusion reactor is discussed In particular, a generalized criterion for assessing the efficacy of Migma-type reactors is described Considerations involved in developing the modified criterion, which is essentially a balance of energy investment and energy return, include the different mechanisms of ion and electron heating, bremsstrahlung and synchrotron radiation, ion charge transfer, multiple Coulomb scattering and secondary fusion reactions A typical plot of the product of density and confinement time versus ion energy for a deuterium-deuteron fuel, derived in accordance with the generalized criterion, is given J M B.

**A77-47369** Unified criterion for proximity to controlled fusion. B C Maglich (Fusion Energy Corp., Princeton, N.J.) (*Fusion Energy Corp., Symposium on Clean Fusion, 1st, Washington, D.C., Apr. 30, 1976*) *Nuclear Instruments and Methods*, vol. 144, July-Aug 1977, p 77-80

A fusion reactor feasibility criterion which incorporates a number of loss terms not represented in the conventional Lawson's Criterion is described This unified criterion has the advantage of expressing in relatively simple terms the efficiency of conversion of external energy into ion fuel energy. The role of ion heating efficiency and the recovery of nonfused ion energy in a Migma-type reactor, as well as determination of optimum plasma density and confinement times, are analyzed by means of the unified criterion Sample calculations for fusion reactions taking place at thermo-nuclear temperatures and for high-energy advanced-fuel fusion are given J M B

Apparatus is described for testing thermionic converters in laboratories or in the presence of solar radiation Experiments involving high-temperature steady-state systems are explained Volt-ampere characteristics, the effect of cathode temperature, the relation between incident and converted energy, and the effect of the reflection coefficient of the mirror were studied M L

**A77-47423** Investigating the geometric quality of cast polyurethane-foam duplicates for solar-energy concentrators. B. A. Bazarov, V. M. Kapeliushnikov, and B. A. Kalinin (Akademiia Nauk Turkmensoi SSR, Fiziko-Tekhnicheskii Institut, Ashkhabad, Turkmen SSR) (*Geliotekhnika*, no 2, 1977, p. 25-29.) *Applied Solar Energy*, vol 13, no. 2, 1977, p. 17-20, 7 refs Translation.

The integral energy distribution of moldings of a solar energy concentrator was compared with that of the original as a method of assaying the precision of duplication. The original was made of glass. The copies were made of polyurethane foam combined with either mosaic glass or polytetrafluoroethylene reflecting films. Short-circuit currents, concentrating capacities, diameters of the focal spots, and the extent of precision are compared. M L

**A77-47424** Concentration of diffuse radiation. V. K. Baranov. (*Geliotekhnika*, no 2, 1977, p. 30-36.) *Applied Solar Energy*, vol 13, no. 2, 1977, p. 21-25, 5 refs. Translation.

A parabolic-toroid solar concentrator and a parabolic-cylindrical solar focusing lens are described. The ability of these focusing devices to concentrate diffuse light from a large source, as from the sun, is considered. An analytical relationship is obtained for the average flux density in the small aperture in terms of the flux density incident at the large aperture. In comparison with lens systems, the focusing concentrator concentrates a much larger amount of diffuse light.

An analysis of possible applications of geothermal energy is presented, including several non-electric projects such as home and space heating, mineral recovery, desalination plants, aquatic farming, and waste processing. The location and evaluation of geothermal reservoirs is outlined in terms of drilling, fluid supply, and subsidence. Geothermal hardware is described, along with the identification of potential ecological problems, and three sources of obtaining geothermal energy are studied: the magma, hydrothermal, and hot dry rock systems. Possible power systems are discussed (the flashed steam, binary, and total flow systems) together with institutional problems of a legalistic nature. S C S

**A77-47749** Predicting the rate of warming of rivers below hydroelectric installations. R. W. Troxler (Georgia, Dept of Natural Resources, Atlanta, Ga.) and E. L. Thackston (Vanderbilt University, Nashville, Tenn.) *Water Pollution Control Federation, Journal*, vol 49, Aug 1977, p. 1902-1912, 6 refs.

The construction and verification of an energy budget model is described for the accurate prediction of temperature changes in flowing rivers based on the approximate geometry of the rivers, and data from first order weather stations. The results of five field surveys to test the model show that (1) atmospheric radiation and back radiation almost balance each other, (2) evaporation and conduction energy transfers are of minor importance, and (3) solar radiation accounted for almost all of the energy transfer. When the river was above the equilibrium temperature it was shown that (1) back radiation would be greater, (2) evaporation and conductive heat transfer would be negative, and (3) the total energy transfer would be negative. Procedures for using hydrogen as an energy source are discussed with attention to economic costs A general scheme for obtaining hydrogen from the nuclear-powered electrolysis of water is presented, and the advantages and disadvantages of electrolytic and thermochemical procedures are examined Among the thermal cycles considered are the oxidation of steam by chlorine, the oxidation of CO by steam, processes using transition element oxides, the hydrolysis of halides, and hybrid cycles The characteristics of hydrogen and hydrides are compared Techniques for shipping and storing hydrogen are described, and problems of energy transmission are considered M L

**A77-47850** Solar energy - The good features of amorphous silicon (Energie solaire - Les promesses du silicium amorphe). I Solomon *La Recherche*, vol 8, Sept 1977, p 776, 777 9 refs In French

A procedure for producing films of amorphous silicon is described For unknown reasons, these films have a very low density of defects It is suggested that amorphous silicon will find application in solar energy devices Amorphous silicon films can be produced by subjecting SiH<sub>4</sub> to a high-frequency field, which causes the gas to become a plasma that decomposes and deposits Si on a substrate maintained at a controlled temperature The addition of phosphine to the SiH<sub>4</sub> leads to the development of an n-type film, while the addition of diborane leads to a p-type film Thus it is easy to prepare large area p-n junctions M L

**A77-47958 \* #** Optimization of confinement in a toroidal plasma subject to strong radial electric fields. J. R Roth (NASA, Lewis Research Center, Cleveland, Ohio) *Institute of Electrical and Electronics Engineers, International Conference on Plasma Science, Troy, N.Y., May 23-25, 1977, Paper, 32 p.* 20 refs.

The toroidal ring of plasma contained in the NASA Lewis Bumpy Torus facility may be biased to positive or negative potentials approaching 50 kV by applying dc voltages of the respective polarity to 12 or fewer midplane electrode rings The radial electric fields, which are responsible for raising the ions to high energies by E x B/B-squared drift, then point out of or into the plasma A preliminary report is given on the identification and optimization of independent variables which affect the ion density and confinement time in the Bumpy Torus plasma The independent variables include the polarity, position, and number of the midplane electrode rings, the method of gas injection, and the polarity and strength of a weak vertical magnetic field Some characteristic data taken under conditions where most of the independent variables were optimized are presented The highest value of the electron number density on the plasma axis is 3.2 trillion per cu cm, the highest ion heating efficiency is 47%, and the longest particle containment time is 2.0 msec. (Author)

**A77-47960 \* #** The NASA thermionic-conversion /TEC-ART/ program J F Morris (NASA, Lewis Research Center, Thermionics and Heat-Pipe Section, Cleveland, Ohio) *Institute of Electrical and Electronics Engineers, Conference on Plasma Science, Troy, N.Y., May 23-25, 1977, Paper 18 p* 11 refs

The NASA program for applied research and technology in thermionic energy conversion is described, and the approaches used to obtain the goal of reduced interelectrode losses, improved emitters, and improved collectors are indicated The current emphasis on out-of-core thermionics allows materials and designs previously prohibited by in-core nucleonics and geometrics Since high-temperature material effects are important for several components, tungsten, 25%-rhenium technology is a subject of research Emitter-vaporization, collector-deposition effects were studied, and improvements in metallic-fluid heat pipes are considered Some required characteristics of electrodes are examined M L

**A77-47968 #** Flywheel hybrid power trains I - Component and drive selection II - Numerical optimization and operation R Saint Laurent and R C Flanagan (Toronto, University, Toronto, Canada) *Engineering Institute of Canada, Annual Congress, 90th, Halifax, Nova Scotia, Canada, Oct 5-8, 1976, Paper 61 p* 31 refs. Research supported by the National Research Council of Canada

Various components are considered for use in flywheel hybrid power trains for vehicles The cycle efficiency of a vehicle was defined with respect to a vehicle with an ideal power train The primary emphasis for component selection is placed on maximizing the cycle efficiency, hence fuel economy A double acting Stirling engine was chosen as the primary power source while a toroidal disk traction drive was chosen as the infinitely variable transmission The flywheel material selected was AISI 4340 steel Part II of this paper

uses the chosen components in a particular configuration of a hybrid commuter car. A computer optimization procedure is used to obtain the highest cycle efficiency. (Author)

**A77-47969 # Thermal energy management techniques in spacecraft design and their potential for terrestrial applications.** S Ahmed and V. A. Wehrle (Department of Communications, Communications Research Centre, Ottawa, Canada). *Engineering Institute of Canada, Annual Congress, 90th, Halifax, Nova Scotia, Canada, Oct 5-8, 1976, Paper. 32 p 24 refs*

Thermal energy management schemes derived from aerospace applications, including multilayer insulation, heat pipes, hollow glass microsphere insulation and surface finishes, are discussed. The operation of conventional, variable conductance and thermal diode heat pipes is described, terrestrial uses of heat pipes, such as stabilization of permafrost adjacent to Arctic oil pipelines, cooling of high-power electronic components, increasing the efficiency of domestic and commercial appliances and applications in solar energy collectors, are considered. The manufacture of multilayer blanket insulation for cryogenic to room temperature applications is described, and use of multilayer insulation in storage containers for liquefied gases is mentioned. Glass microsphere insulation for use in underwater environments, and surface finishes employed in solar heating and cooling of buildings are also discussed. J M B

**A77-47970 # Anaerobic sludge digestion - A potential energy source.** M F Hamoda and D B Cohen (Environment Canada, Wastewater Technology Centre, Burlington, Ontario, Canada). *Engineering Institute of Canada, Annual Congress, 90th, Halifax, Nova Scotia, Canada, Oct 5-8, 1976, Paper. 27 p 18 refs*

The anaerobic sludge digestion process is described, and gas production and utilization are discussed. The characteristics of bacterial action are examined, and single and two-stage systems are distinguished. About 10 to 20 cu ft of gas per pound of volatile solids digested are produced from a well-functioning digester. The digester gas contains about 60 to 70% methane by volume, CO<sub>2</sub> is the other main constituent. Methods of using digester gas for heating the contents of the digester (the most common usage of digester gas) are presented, and internal combustion engines or gas turbines that can use digester gas for power production are characterized. The future potential for gas utilization is considered with attention to economic factors. M L

**A77-47971 # Progress of feasibility reassessment of exploiting Fundy tidal energy.** R H Clark and R L Walker. *Engineering Institute of Canada, Annual Congress, 90th, Halifax, Nova Scotia, Canada, Oct 5-8, 1976, Paper. 43 p 9 refs*

A joint Canadian and provincial government program to assess the technical, environmental and economic feasibility of electrical power generation from tidal energy at the Bay of Fundy (Nova Scotia-New Brunswick) is reviewed. Aspects of the design process, including the choice between single and hydraulically-linked basin schemes, the integration of power plants into existing transmission systems, the development of a finite difference model for more accurate simulation of tidal flow, the estimation of capital costs for plants having capacities from 50 to 10,000 MW and the location and capacity of energy storage facilities, are considered. In addition, utility loads in the Canadian maritime provinces and Quebec through the 1990's are projected, and the relative cost of tidal energy from the proposed Bay of Fundy generating plants is estimated. **A77-48159 Synthetic fuels and combustion.** J P Longwell (Exxon Research and Engineering Co., Linden, N.J., MIT, Cambridge, Mass.). In *Symposium on Combustion (International), 16th, Cambridge, Mass., August 15-20, 1976, Proceedings*. Pittsburgh, Pa., Combustion Institute, 1977, p 1-15. 22 refs

Particular attention in the discussion is given to the conversion of coal to liquid fuels for transportation use. The manufacture of synthetic fuels from coal involves a significant increase in the hydrogen-to-carbon ratio from the comparatively low value of the ratio found in coal. The relative fuel/engine system efficiency for both air and ground transportation is expected to be strongly influenced by the ability of an engine to burn low hydrogen-to-carbon ratio aromatic fuels without formation of carbon particulates, engine deposits, or maintenance problems. Improvement in the ability of aircraft engines to burn highly aromatic, wide boiling range fuels offers the possibility of advances in economics and fuel conservation in air transportation. G R

**A77-48169 NOx from fuel nitrogen in two-stage combustion.** F J Martin and P K Dederick (General Electric Co., Schenectady, N.Y.). In *Symposium on Combustion (International), 16th, Cambridge, Mass., August 15-20, 1976, Proceedings*. Pittsburgh, Pa., Combustion Institute, 1977, p 191-198

A description is presented of the two-stage combustion of gaseous fuel/air mixtures. In the primary stage, the fuel/air mixture is burned as an enclosed premixed, fuel-rich, turbulent jet. In the second stage, jets of dilution (secondary) air are injected into the hot primary products. An investigation is conducted regarding the conversion of NH<sub>3</sub> in the fuel to NO<sub>x</sub> in the products. It is found in all experiments that there is a decrease in the yield of NO<sub>x</sub> for the primary products with increasing equivalence ratio for rich mixtures all the way to the rich experimental limit. The results of the

investigation appear to be entirely consistent with a model reported by Fenimore (1972), at least in a semiquantitative way G.R

**A77-48172** Combustion technology for the improvement of engine efficiency and emission characteristics W Bernhardt (Volkswagenwerk AG, Wolfsburg, West Germany) In Symposium on Combustion (International), 16th, Cambridge, Mass, August 15-20, 1976, Proceedings Pittsburgh, Pa, Combustion Institute, 1977, p 223-232 23 refs

The fuel characteristics required for future engines are considered. It is found that future automotive Otto engines have the potential of comparatively low energy consumption which can be obtained by virtue of efficient lean operation and utilizing the high octane ratings of future fuels at high compression ratios. Future diesel engines preserve high fuel economy, while soot formation and odor are suppressed by utilizing methanol injection or using diesel-water emulsion. An employment of mathematical modeling as a tool for the development of combustion technology is discussed and a description of new methods for the improvement of fuel-air mixture preparation is presented. A new Inlet Manifold-Exhaust-Package (MEP) which integrates a lean thermal reactor is examined, giving attention to aspects of MEP evaluation, the thermal efficiency of MEP-equipped internal combustion engines, and the emission characteristics of a methanol engine G.R

**A77-48173** In situ optical measurement of automobile exhaust gas particulate size distributions - Regular fuel and methanol mixtures E D Hirlman, Jr and S L K Wittig (Purdue University, West Lafayette, Ind) In Symposium on Combustion (International), 16th, Cambridge, Mass, August 15-20, 1976, Proceedings Pittsburgh, Pa, Combustion Institute, 1977, p 245-252, Comments, p 253, 254 26 refs Research supported by the Dammarks Teknisk-Videnskabelige Forskningsrad, NATO, and NSF

**A77-48175** Numerical model of coal gasification in a packed bed A M Winslow (California, University, Livermore, Calif) In Symposium on Combustion (International), 16th, Cambridge, Mass, August 15-20, 1976, Proceedings Pittsburgh, Pa, Combustion Institute, 1977, p 503-513, Comments, p 513, 514 20 refs Contract No W-7405-eng-48

A one-dimensional time-dependent computational model has been developed as a pilot study for the multidimensional simulation of coal gasification in a packed bed, treated as a porous medium. Different gas and solid temperatures are used, and concentrations of eight chemical species ( $N_2$ ,  $O_2$ ,  $H_2O$ ,  $H_2$ ,  $CH_4$ ,  $CO$ ,  $CO_2$ , tar) two forms of water (surface and interior), coal and char are followed in space and time. Numerical results obtained for gasification of a Wyoming subbituminous coal by a mixture of steam and oxygen show reasonable agreement with laboratory measurements. The numerical method retains all time derivatives and treats the nonlinear partial differential equations as an initial-value problem, using implicit methods which are capable of being extended to two or more space dimensions (Author)

**A77-48176** Kinetics of gasification in a combustion pot - A comparison of theory and experiment T Eapen, R Blackadar, and R H Essenhigh (Pennsylvania State University, University Park, Pa) In Symposium on Combustion (International), 16th, Cambridge, Mass, August 15-20, 1976, Proceedings Pittsburgh, Pa, Combustion Institute, 1977, p 515-522 15 refs Research supported by the Pennsylvania Science and Engineering Foundation, Contract No E(49-18)-2030

The reaction of carbon with air in a fixed fuel bed was investigated through analysis of rate equations and through data obtained from experiments involving a combustion pot. The combustion pot, a refractory box accommodating bed depths up to 18 inches, was fueled with various grades of coke or coal, experiments were carried out at air intake and gasification rates comparable to those employed by commercial gasifiers. Kinetic coefficients were obtained from slopes of log/linear plots of gas composition ( $O_2$ ,  $CO_2$  and  $CO$  were studied) with time. It was found that the carbon-air

reaction is diffusion-controlled in the combustion region of the fuel bed, but chemically-controlled in the gasification region, with a temperature coefficient equivalent to 50 kcal activation energy. Possible application of these results to mathematical models of shaft reactors, the Lurgi process, or underground gasification is also mentioned J.M.B

**A77-48177** Reaction rate analysis of borehole 'in-situ' gasification systems I M Stewart and T. F Wall (Newcastle, University, Newcastle, New South Wales, Australia) In Symposium on Combustion (International), 16th, Cambridge, Mass, August 15-20, 1976, Proceedings Pittsburgh, Pa, Combustion Institute, 1977, p 525-533 11 refs Research supported by the National Coal Research Advisory Committee

Two methods of in situ borehole coal gasification, the plug-flow reduction system and the well-stirred oxidation system, are studied. In particular, carbon gasification, strata losses and gas and surface temperatures for a range of coal properties, bed and moisture contents and blast conditions are investigated, and the relative influence of mass transfer and chemical reaction rate on the combustion processes is assessed. Computations describing the combustion reactions suggest that a plug-flow tapering reduction zone is dominated by mass-transfer effects and that a high gasification efficiency may be possible with an oxygen-steam blast and elevated combustion zone exit temperatures. For the well-stirred reactor model, a notable influence of moisture balance on ignition stability is found; in addition, it is concluded that an oxygen-steam blast with preheat could produce synthesis gas at high efficiency in a jet-stirred reactor J.M.B

**A77-48178** Environmental aspects of low Btu gas combustion. M P Heap, T J Tyson, J E Cichanowicz, R Gershman, C J Kau (Ultrasystems, Inc, Irvine, Calif), G B Martin, and W S Lanier (US Environmental Protection Agency, Research Triangle Park, N.C.) In Symposium on Combustion (International), 16th, Cambridge, Mass, August 15-20, 1976, Proceedings Pittsburgh, Pa, Combustion Institute, 1977, p 535-545 14 refs US Environmental Protection Agency Contract No 68-02-1361

A kinetic model describing the formation and destruction of nitrogen oxides was used to study two combined-cycle power plants burning ammonia-containing low-Btu gas derived from coal. The kinetic model, which includes more than 100 reactions, was validated by comparison with data for methane/air combustion in jet-stirred reactors. An advanced-technology high temperature gas turbine with a waste heat boiler and a supercharged boiler with a current-technology gas turbine were investigated via the model; it was concluded that staged combustion schemes involving rich primary zones could result in minimum nitrogen oxides emission levels of 105 ppm for the high-temperature turbine and 100 ppm for the supercharged boiler J.M.B

**A77-48240 \*** Direct-connect tests of hydrogen-fueled supersonic combustors P J Waltrup, G L Dugger, F S Billig, and R C Orth (Johns Hopkins University, Laurel, Md) In Symposium on Combustion (International), 16th, Cambridge, Mass, August 15-20, 1976, Proceedings Pittsburgh, Pa, Combustion Institute, 1977, p 1619-1629 8 refs NASA-supported research

Direct-connect tests of hydrogen-fueled supersonic combustors were performed using arc-heated air at combustor inlet Mach numbers of 2.9 to 3.2. Various axisymmetric combustor geometries of 5.89 and 6.96 cm (inner diameter) inlet were investigated; the fuel was injected from the wall either from a ring of equally spaced holes normal to the air stream, or from a circumferential slot oriented 45 deg downstream. The hole-type injectors, consistently gave better results. The effects of various parameters are examined, and the performance comparison procedure is described. A theoretical model of the supersonic combustion process which includes a pre-combustion shock-compression is used to explain the character of the observed pressure distributions and to assess the effects of the measured heat transfer rates, deduced wall shear, and combustor geometry on performance M.L.

**A77-48257** Solar energy installation for the project 'Motto di Lena' in Minusio/Tessin (Sonnenenergieanlage für das Objekt 'Motto di Lena' in Minusio/Tessin). E Ruosch (Eidgenössische Technische Hochschule, Landis und Gyr Zug AG, Zentralschweizerisches Technikum, Lucerne, Switzerland), B Laumann (Landis und Gyr Zug AG, Lucerne, Switzerland), A Grondler (Kampfer AG, Othmarsingen, Switzerland), and R Meuli *HLH - Zeitschrift für Heizung, Lüftung, Klimatechnik, Haustechnik*, vol 28, Aug 1977, p 289-294. In German.

The considered installation represents now probably the largest solar energy project in Switzerland. The project includes solar energy collectors with an area of 100 sq m and heat storage facilities, based on the use of water, with a volume of 225 cu m. The installation provides energy for heating five apartments and for supplying them with hot water. It was found that, during the first operational year, 72% of the entire energy required could be provided by solar energy. The remainder of the energy needed was supplied by an auxiliary electrical heating system. Attention is given to aspects of constructional design, details concerning the collection and utilization of solar energy, the costs of the system and its operation, and the evaluation of the obtained data. G R.

**A77-48258** The test reference year. A collection of hourly values of interesting weather elements. III - Conversion of the air pressure for other altitudes, equations of the vapor pressure of water, calculation of the position of the sun (Das Test-Referenzjahr: Eine Sammlung stündlicher Werte interessierender Wetterelemente. III - Umrechnung des Luftdruckes auf andere Höhen, Gleichungen der Dampfdruckkurve von Wasser, Berechnung des Sonnenstandes). A Jahn (Berlin, Technische Universität, Berlin, West Germany) *HLH - Zeitschrift für Heizung, Lüftung, Klimatechnik, Haustechnik*, vol 28, Aug 1977, p 295-299. 33 refs. In German.

A number of equations are required in connection with the evaluation and selection of data for a test reference year (TRY) and also in connection with the utilization of the TRY values. The required relations are presented for problem areas for which the corresponding information found in literature is insufficient or nonexistent. Measured data concerning the air pressure are generally converted to values corresponding to an altitude of zero before publication, while the data for temperature and relative humidity are given for the altitude of the climatological station. It is, therefore, often necessary to convert the published air pressure data again to the values corresponding to the station altitude. Suitable approaches for doing this are discussed. Attention is also given to water vapor pressure relations needed for the design of heating and air conditioning systems and to equations required in calculations which take into account the characteristics of direct solar radiation. G R.

**A77-48259** Energy savings obtained by applying the findings of construction physics II (Energieeinsparung durch Anwendung von Erkenntnissen der Bauphysik. II). H Reinders *HLH - Zeitschrift für Heizung, Lüftung, Klimatechnik, Haustechnik*, vol 28, Aug 1977, p. 300-304. 7 refs. In German.

The main problem in connection with the requirements for saving energy in the case of the heating or air conditioning of buildings is related to a minimization of the energy needed to provide and maintain physiologically appropriate conditions concerning the air in the rooms of a building. Theoretical studies and practical experience show that optimal relations are found in the case of an existence of quasi-stationary conditions with respect to the quality of the air in the rooms. The conditions for a thermal equilibrium in buildings are investigated and a description is presented of the results which have been obtained in a theoretical study of seven types of wall design. The effects of various building design factors on the loss of heat from the building are discussed. G R.

**A77-48267** Wind energy - Large and small systems competing. W D Metz *Science*, vol 197, Sept 2, 1977, p 971-973.

Windpower, which is available on an annual basis in amounts comparable to the average energy flux of sunlight in many areas, offers one of the most inexpensive means of producing energy. The

possibilities are investigated for utilizing features available in many windy regions, such as hydroelectric systems, capable of producing energy storage by holding back water while the wind is blowing, and underground gas formations, suitable for compressed air storage. Possible interference with television reception constitutes one of the major objections to wind installations, as television's synchronization speed, 30 cycles per second, is near the rotation speed of large wind systems. The use of fiber-glass blades is suggested as a partial remedy for the problem. Several existing wind machine programs are discussed with regard to construction, cost evaluation, effectiveness, and storage capacities. It is concluded that both large and small wind systems have the potential to compete with conventional electric systems. S C S.

**A77-48301** Is an electric vehicle in your future? E C Hackleman, Jr (Connecticut, University, Storrs, Conn.) *Environmental Science and Technology*, vol 11, Sept 1977, p 858-862.

The electric vehicle is suggested as an alternate solution to automotive pollution and energy problems. Among the advantages of the electric vehicle are fuel economy, low-operating costs, minimal maintenance, and low pollution emission. The major disadvantage of the electric vehicle is that the lead-acid battery wears out rapidly because of repeated recharges. Battery technology has developed several new products, such as the silver-zinc battery, the sodium-sulfur battery, and the lithium-sulfide battery, which are discussed. Potential markets for electric vehicles include both public and commercial transportation. It is concluded that although the electric vehicle has a limited application under current technological parameters, it has great potential for the future as an alternate to the internal combustion vehicle. S C S.

**A77-48472** Soluble-salt processes for in-situ recovery of hydrocarbons from oil shale. M Prats, P J Cloosmann, G Drinkard (Shell Development Co., Houston, Tex.), and A T Ireson (Shell Oil Co., Houston, Tex.) (*American Institute of Mining, Metallurgical and Petroleum Engineers, Annual Fall Technical Conference and Exhibition, 51st, New Orleans, La., Oct 3-6, 1976*) *Journal of Petroleum Technology*, vol 29, Sept 1977, p 1078-1088. 13 refs.

This paper describes a class of in situ shale-oil recovery processes in which permeability and porosity are developed by dissolution of soluble salts. These processes consist of two steps that may be conducted simultaneously or sequentially: leaching of soluble salts and conversion of kerogen. (Author)

**A77-48473** Underground coal gasification - A status report. L A Schrider and C E Whieldon (Morgantown Energy Research Center, Morgantown, W Va.) (*American Institute of Mining, Metallurgical and Petroleum Engineers, Eastern Regional Meeting, Columbus, Ohio, Nov 18-19, 1976*) *Journal of Petroleum Technology*, vol 29, Sept 1977, p 1179-1185. 14 refs.

Three in situ coal gasification techniques, the packed bed reactor approach for thick seams (50 ft or greater), the longwall generator concept for thin seams (15 ft or less), and the linked vertical well method for intermediate seams (15 to 50 ft), are described. The second Hanna experiment, which tested the linked well method, is discussed, with attention to the instrumentation techniques used. The results of the Hanna experiments show a marked improvement with each successive test as a result of higher injection rates and the backpressuring of the formation. These procedures have produced a favorable air/water ratio for in situ coal gasification. Phases 2 and 3 of Hanna experiment are compared. M. L.

**A77-48478** BI-gas pilot plant processes 5 tph. R A Weaver, Jr *Coal Mining and Processing*, vol 14, Sept. 1977, p. 86-88, 90, 122.

A process for the production of high-Btu pipeline gas from coal is described. Among the system's advantages are a high yield of methane, total consumption of feed coal, and the absence of tar and oil formation in the gasification process. The pilot plant design is outlined with attention to the individual support systems. Discussed in greater detail are (1) coal receiving and preparation, (2) the

high-pressure slurry-feed system, (3) the gasifier system, (4) the slag removal system, (5) gas clean-up, and (6) gas conversion. S.C.S.

**A77-48480** Space-based solar power study near completion. B M Elson *Aviation Week and Space Technology*, vol 107, Sept. 19, 1977, p 58, 59, 62-65, 68, 69.

The concept of solar power systems is discussed with regard to potential energy conversion schemes. Two such systems have been found to be equally effective for the project (1) photovoltaic devices (solar cells) which would convert sunlight directly into electricity by means of solar cell arrays scaled at about 100 sq km for a 10 GW output at the busbars on the ground, and (2) thermal engines (two versions of which are feasible at the present time, the closed Brayton cycle using helium as the working fluid, and the potassium vapor Rankine cycle) which would convert sunlight into electricity via turbomachinery rather than solar cells. Satellite construction techniques, cost evaluation, and flight experimentation are reviewed. S C S

Golden (Stanford Research Institute, Menlo Park, Calif.), and S W Benson (Southern California, University, Los Angeles, Calif.) *Journal of Physical Chemistry*, vol 81, Sept 8, 1977, p. 1716-1729. 25 refs Contract No. E(49-18)-2202

**A77-48493** Antenna design for offshore satellite links. M R Braine (Marconi Communication Systems, Ltd., Chelmsford, Essex, England) *Microwave Journal*, vol 20, Sept 1977, p 59-61

A description is presented of the various factors which have to be considered in the design of an offshore antenna system that is to be installed on oil production platforms in the North Sea for communications applications involving a use of the European Communications Satellite. Attention is given to general design considerations, tracking and stabilization systems, error factors, radome options, and a performance/cost analysis. G R

**A77-48496** Further Stirling engine development work I (Weiterentwicklungen am Stirlingmotor. I) F Zacharias *Motor-technische Zeitschrift*, vol 38, Sept 1977, p 371-374, 377 17 refs. In German

Advantages of the Stirling engine, as obtained in experimental models, are related to high efficiency, a small amount of pollutants in the exhaust gas, and low operational noise levels. A survey is provided regarding the development trends of the engine, taking into account the thermodynamic conditions in the case of the double-acting engine. The Stirling engine makes use of heat exchangers and helium or hydrogen as operational medium. Attention is given to the operational phases in a 4-cylinder Stirling in-line engine, the necessity to employ higher process theory in connection with engine design studies, the pressure and temperature characteristics of the engine, and various process control techniques. G R

**A77-48502** Science and technology of oil shale. Edited by T F Yen (Southern California, University, Los Angeles, Calif.) Ann Arbor, Mich., Ann Arbor Science Publishers, Inc., 1976 232 p \$32 50

A systematic review of oil shale research is presented including papers which discuss U.S. oil shale deposits, modification of the mineral matrix by bioleaching, mild oxidation procedures for bioleaching oil shale, electrolytic oxidation and reduction of oil shale, and pulsed nuclear magnetic resonance for the estimation of potential oil yields. Retorting of oil shale is presented with regard to indexes for oil shale pyrolyses from ethylene/ethane ratios of product gases, and polycondensed aromatic compounds and carcinogens in shale ash of carbonaceous spent shale. Environmental concerns are outlined along with sulfur recovery in a biochemical method of oil shale production, microbial degradation of oil shale, and structural investigations of kerogen's hydrogen structure. S C S

**A77-48503** Wind power - Pipe dream or reality. F Hirschfeld *Mechanical Engineering*, vol 99, Sept 1977, p. 20-28

It has been estimated that the power which is potentially attainable from the surface winds over the U.S. is more than 30 times the probable total power consumption of the U.S. by 1980. However, attempts to utilize this resource for power generation applications in the past have generally not been economically successful. In connection with the energy crisis, the federal government has undertaken a program for the development of economical wind systems capable of providing up to 30 years of reliable, automatic, relatively maintenance free service. The program includes plans for the development of a 1.5-MW horizontal-axis, propeller-type experimental wind turbine generator with a composite rotor 61 m in dia. Attention is given to an experimental 100-kW unit, a review of prominent wind-power projects in the first half of the 20th century, the development and promotion of wind systems for farm and rural use, and questions of economic viability. G.R.

**A77-48517** # Energy output and service life characteristics of high-voltage low-temperature thermopiles (Energeticheskie i resursnye kharakteristiki vysokovol'tnykh nizkotemperaturnykh termobatarei) L D Dudkin, A N Moskalev, A. E. Nadzhip, O B Sokolov, and A Ia Terekov (Vsesoiuznyi Nauchno-Issledovatel'skii Institut Istochnikov Toka, Moscow, USSR) *Geliotekhnika*, no 3, 1977, p 3-7 In Russian

The article discusses the design of low-temperature high-voltage thermopiles featuring a high ratio of output voltage to unit power drain U/W (ratio roughly ten) capable of operating at temperatures from 50 to 300 C over a 200 C temperature drop. Extruded rods of low-temperature thermoelectric materials with such a ratio are used in fabricating the thermopiles. 4000-h lifetime tests run on specimens with hot-junction temperatures near 270 C revealed no degradation of thermopile energy output or performance. R D V

**A77-48518** # Photoelectric and electrical properties of n-SiC - n-CdS heterojunctions (Fotoelektricheskie i elektricheskie svoistva nSiC-nCdS-geteroperekhodov) Sh A Mirsagatov, M Duisenbaev, and D T Rasulov (Akademiia Nauk Uzbekskoi SSR, Fiziko-Tekhnicheskii Institut, Tashkent, Uzbek SSR) *Geliotekhnika*, no 3, 1977, p 8-11 5 refs In Russian

Dark voltage-current and voltage-capacitance characteristics of n-type (SiC + CdS) heterojunctions were investigated, in order to ascertain the mechanism of current transport through the structure. The heterojunctions were fabricated by thermal vaporization of CdS powder in vacuum and sputtering onto alpha-SiC specular surfaces. Metallic contacts to the CdS films were applied by sputtering of In and Au Ohmic contacts to the SiC were fashioned by fusing a mixture of Ni + W powders. Spectral dependences of photo-sensitivity, photo-emf, and short-circuit current (on intensity of incident light) were taken. R D V

**A77-48519** # Procedure for calculating thermocompressor thermodynamical parameters (Metodika rascheta termodinamicheskikh parametrov termokompressora) A G Popov and V S Trukhov (Akademiia Nauk Uzbekskoi SSR, Fiziko-Tekhnicheskii Institut, Tashkent, Uzbek SSR) *Geliotekhnika*, no 3, 1977, p 12-19 7 refs In Russian

A procedure for calculating the thermodynamical performance characteristics of a thermocompressor operating on a modified Stirling cycle is worked out. An ideal thermocompressor model is developed, with constant temperatures in hot and cold zones, identical masses of working fluid taken in and exhausted over a cycle at constant pressures, no leaks, no friction, no drag, and with an ideal regenerator. Design with rod diameter taken into account and left out of account are considered. The thermal efficiency of the ideal thermocompressor is found to increase with compression ratio and to decline when monatomic working fluid is replaced by diatomic. R D V

**A77-48521** # Shortened focusing concentrators and focusing wedges (Ukorochennyye fokony i fokiliny) M V Braslavskaya and V K Baranov *Geliotekhnika*, no 3, 1977, p 25-30 In Russian

Graphs and tabular data are presented on the parameters of parabolic torus solar energy concentrators and parabolic cylinder

focusing wedges. Straightforward determination of the performance parameters of shortened focusing concentrators and focusing wedges as functions of specified element depth or allowable degradation of concentration ratio is addressed. Spatial selectivity and aperture dimensions of the solar array elements are defined and formulated. Shortening a concentrator by a third, and a wedge by a half, is found to result in only 10% degradation in concentration. R D V

**A77-48522 # Contribution to procedures for testing Silazan resin coatings (K metodike ispytani silazanovykh pokryti)** R A. Zakhidov, A I Ismanzhanov, and L A. Dubrovskii (Akademiia Nauk Uzbekskoi SSR, Tsentral'noe Proektno-Konstruktorskoe i Tekhnologicheskoe Biuro Nauchnogo Priborostroeniia, Uzbek SSR) *Geliotekhnika*, no 3, 1977, p 31-35 6 refs. In Russian

Procedures for accelerated ageing tests on Silazan resin protective coatings and statistical processing of test data are outlined. Resin coatings on solar concentrators are tested under various intensified solar UV radiation patterns simulating five-fold or forty-fold UV intensities. Mercury lamps are employed in the accelerated exposures. Parameters for the accelerated ageing tests, functions linking the lifetime and operating conditions of the coated object, and conversion of test results are discussed. R D V

**A77-48523 # Radiative heat transfer in cavity type axisymmetric collectors for high-temperature solar energy plants (Luchisty teploobmen v polostnykh osesimmetrichnykh priemnikakh vysokotemperaturnykh solnechnykh ustanovok)** R A Zakhidov and Sh I Klychev (Akademiia Nauk Uzbekskoi SSR, Tsentral'noe Proektno-Konstruktorskoe i Tekhnologicheskoe Biuro Nauchnogo Priborostroeniia, Uzbek SSR) *Geliotekhnika*, no 3, 1977, p 39-44 7 refs. In Russian

Radiative heat transfer in cavity type solar collectors was investigated with the object of arriving at useful simplifications in early-design selection of cavity parameters. A computer program is developed and the effect of optical-geometrical cavity parameters on heat flux is investigated, with attention given to the concentration field. Relationships between influx distribution and redistributions of outward-going flux are explored. R D V

**A77-48525 # Experience in constructing a solar energy cadastral survey (Opyt postroeniia gelioenergeticheskogo kadastra)** R B Salieva (Tashkentskii Elektrotekhnicheskii Institut Sviazi, Tashkent, Uzbek SSR) *Geliotekhnika*, no 3, 1977, p 56-64 18 refs. In Russian

Basic purposes of a solar energy cadastral survey incorporating objective numerical data based on an adequate stochastic model are outlined. The survey is intended to provide a data base for exploitation and storage of solar energy and for forecasting of favorable insolation conditions, with benefits in electric power, communications, refrigeration and heating, irrigation, and water resources management. The microstructure of solar radiation exposure is broken down from a continuous series to phase-homogeneous periods lasting one calendar month. Histograms, tables, and graphs are compiled as aids in determining repeatability of solar radiation patterns. R D V

**A77-48570 # A simple physical model of a magneto-hydrodynamic generator (Prostreshara fizicheskaiia model' magnitogidrodinamicheskogo generatora)** I Ia Plotnikov (Akademiia Nauk SSSR, Institut Kosmofizicheskikh Issledovani i Aeronomii, Yakutsk, USSR) *Geomagnetizm i Aeronomiia*, vol 17, July-Aug 1977, p 772, 773. In Russian

A physical model is developed to study the ambiguity of the MHD approximation caused by the effects of the density of the vortical and static electromotive force. A stationary shear flow is constructed whose vortex lines are directed along an applied magnetic field with the shear flow formed by two parallel walls of a rectangular tube. The profile of the Couette flow obtained reveals the character of the local interaction of the magnetic field and the vortex flow where the magnetic field facilitates deceleration and reversal of the stream in the region of the stationary wall. S.C.S

**A77-48571 # MHD power generation with fully ionized seed** H Yamasaki and S Shioda (Tokyo Institute of Technology, Tokyo, Japan) *Journal of Energy*, vol 1, Sept-Oct 1977, p 301-305 13 refs

Recovery of power density in the regime of fully ionized seed has been demonstrated experimentally using an MHD disk generator with the effective Hall parameter up to 5.0 when the seed was fully ionized. The experiments were conducted with a shock-heated and potassium-seeded argon plasma under the following conditions: stagnation gas pressure = 0.92 atm, stagnation gas temperature = 2750 K, flow Mach number = 2.5, and seed fraction =  $1.4 \times 10^{-5}$ . Measurements of electron number density and spectroscopic observations of both potassium and argon lines confirmed that the recovery of power output was due to the reduction of ionization instability. This fact indicates that the successful operation of a disk generator utilizing nonequilibrium ionization seems to be possible and that the suppression of ionization instability can also provide higher adiabatic efficiency. Furthermore, the lower seed fraction offers technological advantages related to seed problems. (Author)

**A77-48647 # Thermal properties of subsurface rocks in the Ukraine (Teplovyie svoystva pripoverkhnostnykh porod territorii Ukrainy)** V V Gordienko and O V Zavgorodniaia (Akademiia Nauk Ukrainskoi SSR, Institut Geofiziki, Kiev, Ukrainian SSR) *Geofizicheskii Sbornik*, no 76, 1977, p 82-86 8 refs. In Russian

Temperature measurements at depths of 0.2 and 3.2 m and determinations of the volumetric specific heat for subsurface rocks were obtained. Values of the thermal diffusivity (average, 7 times  $10^{-5}$  to the minus third  $\text{cm}^2/\text{sec}$ ) and of the heat conductivity (2 times  $10^{-1}$  to the minus third  $\text{cal}/(\text{cm} \cdot \text{deg} \cdot \text{sec})$ ) are presented. In general, the results agree with earlier data. Applications of the data are considered. M L

**A77-48701 Intersociety Energy Conversion Engineering Conference, 12th, Washington, D C, August 28-September 2, 1977, Proceedings. Volumes 1 & 2** Conference sponsored by ANS, SAE, ACS, ASME, AIAA, IEEE, and AIChE. La Grange Park, Ill., American Nuclear Society, Inc., 1977. Vol 1, 1007 p, vol 2, 986 p. Price of two volumes, members, \$45, nonmembers, \$100.

The papers in this collection deal with continuing advances in the search for and development of new sources of energy and more efficient processes that consume energy. The topics cover a wide range, including advanced auto propulsion, alternative fuels, Brayton cycle engines, fluid bed combustion, geothermal and solar power systems, Rankine cycle engines, thermionics, and wind power.

**A77-48702 Comparing alternative methods of improving fuel economy** S Luchter and C J Daye (ERDA, Washington, D C) In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D C, August 28-September 2, 1977, Proceedings Volume 1. La Grange Park, Ill., American Nuclear Society, Inc., 1977, p 29-10 refs.

An analytical method is proposed that allows one to determine the effect of design changes on vehicle fuel economy. The method relates the energy required to accomplish the composite driving cycle to the inertia weight of the vehicle and a vehicle fuel consumption parameter. As examples of technology improvements, continuously variable transmission and aerodynamic drag reduction are considered. It is shown that weight reductions, when properly coupled to engine downsizing, can significantly improve fuel economy, especially for lighter-weight vehicles. Improvement in engine and drivetrain performances can likewise improve overall fuel economy, especially for heavier automobiles. P T H

**A77-48703 The ERDA automotive gas turbine program** C S Chen (ERDA, Div of Transportation Energy Conservation, Washington, D C) In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D C, August 28-September 2, 1977, Proceedings Volume 1. La Grange Park, Ill., American Nuclear Society, Inc., 1977, p 10-17.

The automotive gas turbine engine was examined for possible introduction during the 1980-1990 time period. Technical analysis was made of the gas turbine engine as alternative to the conventional engine. This alternative was evaluated from a societal point of view on terms of energy consumption, urban air quality, cost to the consumer, materials availability, and industry impact. The results show that the gas turbine engine offers the promise of eliminating the automobile as a significant source of urban air pollution, dramatically reducing fuel consumption, and being saleable. Specifically, the gas turbine engine requires intensive component, systems, and manufacturing process development by the auto industry. The current ERDA/Chrysler automotive gas turbine program indicates the earliest date for marketplace introduction of gas turbine cars is the 1986-87 time period. (Author)

**A77-48704** Improving automobile fuel economy with advanced transmissions. R. Kost and S. Luchter (U.S. Department of Transportation, Washington, D.C.) In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D.C., August 28-September 2, 1977, Proceedings Volume 1. La Grange Park, Ill., American Nuclear Society, Inc., 1977, p. 18-25. 6 refs.

The paper examines the fuel economy advantages of the continuously variable transmission over the conventional automatic transmission types and their projected improvements. A given engine is shown to operate more efficiently with a continuous automatic transmission than with conventional automatic transmission. The two most promising continuous automatic transmission candidates are the hydromechanical and traction-type transmissions. Some developmental work on these two concepts is briefly described.

**A77-48705** Continuously-variable transmission concepts suitable for flywheel hybrid automobiles. A. A. Frank, N. H. Beachley, R. W. Harter, A. P. Dietrich, and K. C. Lau (Wisconsin, University, Madison, Wis.) In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D.C., August 28-September 2, 1977, Proceedings Volume 1. La Grange Park, Ill., American Nuclear Society, Inc., 1977, p. 26-33. 14 refs. U.S. Department of Transportation Grant No. OS-60177.

**A77-48706** Computer predicted compression ratio effects on NOx emissions from a methanol fueled SI engine. L. H. Browning and R. K. Pefley (Santa Clara, University, Santa Clara, Calif.) In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D.C., August 28-September 2, 1977, Proceedings Volume 1. La Grange Park, Ill., American Nuclear Society, Inc., 1977, p. 37-43. 14 refs. Research supported by the U.S. Environmental Protection Agency and ERDA.

A combustion kinetics computer model was used to study the compression ratio effects on performance and emissions of a methanol fueled spark ignition (SI) engine. Earlier experimental work by two independent research workers had shown that volumetric NOx emissions decreased when compression ratio was increased from 9.7:1 to 14:1 at MBT spark settings. The computer model, however, predicted a continual increase in volumetric NOx emissions for increasing compression ratio at MBT spark timing. With only a 3-deg retard from MBT, the computer-predicted volumetric NOx emission at 14:1 compression ratio was reduced to that at 8.44:1 compression ratio and MBT spark timing. With this spark retard setting, there was a net increase in power and thermal efficiency of 13.7% relative to the MBT values at 8.44:1 compression ratio. (Author)

**A77-48707** Cassava fuel alcohol in Brazil. V. Yang, W. N. Milfont, Jr., A. Scigliano, C. O. Massa, S. Sresnewsky, and S. C. Trindade (Centre de Tecnologia Promon, Rio de Janeiro, Brazil.) In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D.C., August 28-September 2, 1977, Proceedings Volume 1. La Grange Park, Ill., American Nuclear Society, Inc., 1977, p. 44-53. 10 refs.

Energetics and economics of ethanol production from cassava under Brazilian conditions were analyzed. A 150 cu m/day alcohol distillery based on batch conversion and fermentation steps and employing a totally enzymatic process was the base distillery chosen. Comparison with alcohol production from sugar cane juice was made. Prospects for process energy improvements and effects on alcohol production costs are discussed and compared to base-distillery results. Net energy/ratio concept was used as basis for process energetics analysis. Sharp increase in cassava agriculture productivity is expected to considerably improve cassava fuel alcohol economics. (Author)

**A77-48708** Exhaust and evaporative emission from a Brazilian Chevrolet fueled with ethanol-gasoline blends. R. L. Furey and M. W. Jackson (General Motors Corp., Warren, Mich.) In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D.C., August 28-September 2, 1977, Proceedings Volume 1. La Grange Park, Ill., American Nuclear Society, Inc., 1977, p. 54-61. 8 refs.

Exhaust and evaporative emissions from a 1974 Brazilian Chevrolet Opala were measured using gasoline and various ethanol-gasoline mixtures. For this car, which was designed to operate with rich air-fuel mixtures, addition of up to 20 percent ethanol to gasoline reduced exhaust hydrocarbon and carbon monoxide emissions, but increased exhaust aldehyde and nitrogen oxide emissions. The leaning of the air-fuel mixture, due to ethanol addition, was the primary cause of the exhaust emission changes. Evaporative emissions were slightly higher with 10 percent ethanol in gasoline, than with gasoline alone. (Author)

**A77-48709** Alternate fuels for future aircraft. G. D. Brewer (Lockheed-California Co., Burbank, Calif.) In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D.C., August 28-September 2, 1977, Proceedings Volume 1. La Grange Park, Ill., American Nuclear Society, Inc., 1977, p. 62-68. 10 refs.

The paper mentions some results of comparisons of the applicability of liquid hydrogen-fueled aircraft of the future and equivalent aircraft fueled with Jet A. Liquid hydrogen-fueled aircraft show clear superiority stemming from better lift-to-drag ratio in cruise and the specific fuel consumption realized during cruise. These advantages are retained when supersonic transport aircraft are considered as well. At the moment, studies indicate that it would cost more to build and operate a hydrogen-fueled fleet than a fleet fueled with synthetic Jet A, but if one takes into account projected improvements in the production process for liquid hydrogen (hydrogen gasification) and for synthetic Jet A, the LH2-fueled aircraft comes out ahead. (Author)

**A77-48710** Utilizing methane from coalbeds. G. E. Voelker (ERDA, Washington, D.C.) In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D.C., August 28-September 2, 1977, Proceedings Volume 1. La Grange Park, Ill., American Nuclear Society, Inc., 1977, p. 78-82.

The paper discusses the possibility of recovering some of the estimated 240 trillion cubic feet of recoverable methane gas trapped in coal and surrounding rock strata in U.S. coal fields and which is currently being vented to the atmosphere during coal mining operations. The results of a study of the economic viability of various combinations of recovery and utilization options are presented indicating that the recovery and utilization of coalbed methane gas is practical and economically favorable in many instances. Near-term objectives of the ERDA program for coalbed methane conservation are selection and demonstration of promising systems and technologies for recovery, development of on-site systems for demonstration, and investigation of legal aspects of coalbed methane utilization. **A77-48711** Synthetic carbonaceous fuels and feedstocks from oxides of carbon and nuclear power. M. Steinberg (Brookhaven National Laboratory, Upton, N.Y.) In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D.C., August 28-September 2, 1977, Proceedings Volume 1. La Grange Park, Ill., American Nuclear Society, Inc., 1977, p. 89-93. 10 refs.

sion Engineering Conference, 12th, Washington, D C, August 28-September 2, 1977, Proceedings Volume 1 La Grange Park, Ill, American Nuclear Society, Inc, 1977, p 83-89 13 refs

Four sources of carbon oxides for conversion to synthetic fuels and feedstocks are considered the blast furnace, limestone calcination, coal-fired power plants, and a new system for fixation of atmospheric CO<sub>2</sub>. Methanol and gasoline can be produced from the top gas of an oxygen-blown blast furnace in combination with a nuclear-electrolytic system. Steam calcination of limestone using nuclear power would produce as a by-product synthetic carbonaceous fuels. Stack gas CO<sub>2</sub> can be converted to synthetic carbonaceous fuels by a nuclear-electrolytic process. For recovering CO<sub>2</sub> in the atmosphere, a process is proposed that depends on the electrolytic decomposition of water containing higher concentrations of carbonate/bicarbonate ion. P T H

**A77-48712 Solid fuels from biomass - Some environmental and economic considerations** C W Vail and J-F. Henry (InterTechnology/Solar Corp, Warrenton, Va) In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D C, August 28-September 2, 1977, Proceedings Volume 1 La Grange Park, Ill, American Nuclear Society, Inc, 1977, p 90-93 12 refs

A hypothetical woody biomass plantation with a given operating schedule was analyzed in terms of the universal soil loss equation in order to estimate the average amount of soil lost to erosion over an extended period of plantation operation. It is shown that such an energy plantation culture is less intense than traditional agriculture. Thus, lands classified as marginally fit for agriculture can be used to produce biomass crops on a renewable basis. The cost of producing fuel with the required conservation measures is estimated to be slightly more than \$1.20 per million Btu. P T H

**A77-48713 The prospects for fuels from biomass** E S. Lipinsky (Battelle Columbus Laboratories, Columbus, Ohio) In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D C, August 28-September 2, 1977, Proceedings Volume 1 La Grange Park, Ill, American Nuclear Society, Inc, 1977, p 94-99 9 refs ERDA-supported research

The prospects for making fuels from biomass are investigated by considering the process of converting sugarcane to ethanol and studying the economics of ethanol as a motor fuel. A cost analysis is made for a large ethanol distilling plant, and it is found that the cost of anhydrous ethanol would be about \$0.31 per liter. Adding anhydrous ethanol in a suitable gasoline blend would increase the selling price of gasoline \$0.015 to \$0.021 per liter. P T H

**A77-48714 \* Conceptual design of closed Brayton cycle for coal-fired power generation** R. P. Shah and J. C. Corman (General Electric Co, Schenectady, N Y) In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D C, August 28-September 2, 1977, Proceedings Volume 1 La Grange Park, Ill, American Nuclear Society, Inc, 1977, p 158-165 ERDA-NSF-sponsored research, Contract No. NAS3-19406

The objectives to be realized in developing a closed cycle gas turbine are (1) to exploit high temperature gas turbine technology while maintaining a working fluid which is free from combustion gas contamination, (2) to achieve compact turbo-equipment designs through pressurization of the working fluid, and (3) to obtain relatively simple cycle configurations. The technical/economic performance of a specific closed cycle gas turbine system was evaluated through the development of a conceptual plant and system design. This energy conversion system is designed for electric utility service and to utilize coal directly in an environmentally acceptable manner. (Author)

**A77-48716 Light commercial Brayton/Rankine space conditioning system** D. Friedman (AirResearch Manufacturing Company of California, Los Angeles, Calif) In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D C, August 28-

September 2, 1977, Proceedings Volume 1 La Grange Park, Ill, American Nuclear Society, Inc, 1977, p 172-178

A heat-actuated space conditioning system that provides more efficient use of natural gas has been developed for 26.4- to 87.8-kW commercial applications. The system consists of a subatmospheric natural-gas-fired Brayton cycle engine that drives a Rankine cycle heat pump. A centrifugal freon compressor is driven directly from the Brayton engine rotating group through a permanent magnet coupling. Unique features that offer high life cycle performance include a hermetically sealed magnetic coupling, air foil bearings, an atmospheric in-line combustor, and a high temperature recuperator. Predicted overall engine efficiency is 27 percent and predicted overall coefficient of performance at the energy source is 0.85 in cooling and 1.0 in heating. (Author)

**A77-48717 Thermal scale modeling of the central receiver of a helium Brayton cycle solar powerplant** R. C. Zentner and R. L. Shannon (Boeing Co, Engineering and Construction Div, Seattle, Wash) In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D C, August 28-September 2, 1977, Proceedings Volume 1 La Grange Park, Ill, American Nuclear Society, Inc, 1977, p 179-186 Research supported by the Electric Power Research Institute and Boeing Co

The paper describes a commercial central receiver solar power plant concept which utilizes Brayton cycle turbomachinery in an intermediate load power plant role. A one megawatt solar receiver, the Bench Model Solar Receiver, will be used to evaluate the central receiver design. Characteristics of this test model which are similar to those of the commercial unit include its heat exchanger operating temperatures, up to 870 C, insulation wall temperatures of about 1090 C, and thermal performance. Several aspects of the engineering and design of the receiver model are discussed, and theoretical design requirements for thermal similitude are considered. M L

**A77-48718 System evaluation of aircraft-derivative gas turbines for naval ship propulsion applications** S. C. Kuo and T. L. O. Horton (United Technologies Research Center, East Hartford, Conn.) In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D C, August 28-September 2, 1977, Proceedings Volume 1 La Grange Park, Ill, American Nuclear Society, Inc, 1977, p 187-193 9 refs Navy-supported research

A projection has been made for the typical specific weights which can be expected for naval ship propulsion systems utilizing large aircraft-derivative open-cycle engines in the early 1990's. The expected performance, size, and weight characteristics for these engines were identified and integrated with the expected future characteristics for the remaining conventional propulsion system components to estimate the total propulsion system specific weight. Several propulsion system arrangements were considered and the most promising were used to predict the payload/endurance relationship for the selected naval ship types considered. (Author)

**A77-48719 A ceramic heat exchanger for exhaust fired gas turbine power cycles** I. G. Most and K. G. Hagen (Hague International, South Portland, Me.) In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D C, August 28-September 2, 1977, Proceedings Volume 1 La Grange Park, Ill, American Nuclear Society, Inc, 1977, p 194-199. 5 refs.

Until recently, combustion of solid fuels such as forest product residues, municipal waste, or coal in gas turbine power cycles has been limited by the corrosive action of the combustion products. A heat exchanger which can operate in this corrosive environment has been developed, making the exhaust fired gas turbine an economically viable power source. This heat exchanger is fabricated from a silicon carbide based ceramic and is a cross-counter flow shell and tube design. Use of this ceramic allows combustion product temperatures in excess of 1590 K. Operational and experimental experience has confirmed the heat exchanger performance characteristics and mechanical integrity under both thermal and physical abuse. This paper describes the design technique used in arriving at a

satisfactory heat exchanger for the exhaust fired cycle. A parametric analysis, based on heat exchanger inlet temperature, leads to a heat exchanger choice that yields the required effectiveness with minimum size and pressure drop. (Author)

**A77-48721 ERDA/P&WA program for demonstration of advanced industrial gas turbine cooling and high pressure compressor technology.** J K Schweitzer and B T Brown (United Technologies Corp., Pratt and Whitney Aircraft Group, East Hartford, Conn.) In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D C., August 28-September 2, 1977, Proceedings, Volume 1 La Grange Park, Ill., American Nuclear Society, Inc., 1977, p. 216-222

The objective of this program is to demonstrate the utilization of advanced aircraft turbine cooling and high pressure compressor technology to achieve high performance, improved durability, and low initial cost in a 15,000 shp/10Mw class industrial gas turbine. Conceptual engine optimization studies and the detailed analytical and mechanical design of the compressor and turbine critical-component test rigs have been completed. Component validation testing and a gas generator demonstrator test are planned in subsequent phases. The advanced single-spool compressor employs low aspect ratio axial compressor blading and a centrifugal back end stage to achieve 18:1 pressure ratio at 90% polytropic efficiency in only seven stages. An innovative turbine air cooling approach in which the airfoils are fabricated from a series of bonded wafers with intricate convective cooling passages is utilized to attain a 20,000 hour life at a combustor exit temperature of 1371 C (2500 F). Predicted specific fuel consumption at ISO conditions is 0.23 kg/hr/kw (0.38 lb/hr/hp). Future development of thermal barrier coatings may permit a further increase in combustor exit temperature to approximately 1593 C (2900 F). (Author)

**A77-48722 Development of the Westinghouse coal gasification process - A status report.** L A Salvador, J D Holmgren, L K Rath, and P J Margaritis (Westinghouse Research and Development Center, Waltz Mill, Pa.) In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D C., August 28-September 2, 1977, Proceedings, Volume 1 La Grange Park, Ill., American Nuclear Society, Inc., 1977, p. 224-231 ERDA-sponsored research

The paper describes the development of a fluidized-bed low-Btu coal gasification process for use in combined-cycle electric power generation. Devolatilization and gasification are the two main steps in the process. In the devolatilizer, unpretreated coal is fed to a recirculating fluidized bed operating at 1150 kPa (225 psig) and 870 C (1600 F) in which it is cracked and devolatilized to produce a char product and a product gas. The char is fed to the gasifier where it is combusted with air and gasified with steam to produce a dry granular agglomerated ash product. Process development activities are carried out in a 14,000 kg/d (15 t/d) process development unit (PDU). Feasibility of the devolatilizer reactor was demonstrated using a variety of coals. The gasifier reactor feasibility demonstration is in progress, the unit has produced agglomerated ash. (Author)

**A77-48723 Performance of gas-turbines and combined cycles operating on fuels produced by in-situ gasification of lignite.** J F Branch, P S Schmidt, and T F Edgar (Texas University, Austin, Tex.) In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D C., August 28-September 2, 1977, Proceedings, Volume 1 La Grange Park, Ill., American Nuclear Society, Inc., 1977, p. 232-238 10 refs

This paper analyzes the utilization of low-BTU gas from in-situ combustion of lignite in gas turbines and combined cycles. Several gas compositions are considered, corresponding to various lignite conversion conditions. The analysis takes into account the work requirements for turbine blade cooling, gasification air, and fuel gas compression, as well as air compression for the gas turbine itself. It is demonstrated that overall cycle efficiency tends to degrade somewhat as fuel heating value decreases, primarily because of the higher work requirements to compress the fuel. At optimum efficiency, the gas turbine carries a larger share of the overall load compared to the

steam turbine for the low BTU gas versus natural gas. It is also shown that the gain in efficiency by increasing firing temperature from 2400 to 3000 F is largely offset by the air requirements for turbine blade cooling. (Author)

**A77-48724 Coal gasification combined-cycle pilot plant system analysis.** T T Kao, S M Cho, R A McCallister (Foster Wheeler Energy Corp., Livingston, N.J.), and R S. Kane (Foster Wheeler Energy Corp., Livingston, N.J., Manhattan College, Manhattan, N.Y.) In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D C., August 28-September 2, 1977, Proceedings, Volume 1 La Grange Park, Ill., American Nuclear Society, Inc., 1977, p. 239-247. 8 refs. Research supported by the Foster Wheeler Energy Corp., Grant No. FE-14-32-001-1521

A detailed computer model has been developed for the system simulation of an integrated coal gasification combined-cycle pilot plant using an air-blown, two-stage, entrained flow, slagging gasifier. The pilot plant system is described by a system of partial differential and algebraic equations governing the energy, material and momentum balance of the pilot plant. Both steady-state and transient studies have been carried out with a computer code in order to investigate the pilot plant performance characteristics, as well as component interface under various operating conditions. The results indicate that the integrated coal gasification combined-cycle pilot plant can perform satisfactorily in all cases studied. (Author)

**A77-48725 The zinc-bromine battery - Possible candidate for electric vehicles and load leveling.** F G Will (General Electric Co., Schenectady, N.Y.) In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D C., August 28-September 2, 1977, Proceedings, Volume 1 La Grange Park, Ill., American Nuclear Society, Inc., 1977, p. 250-255 7 refs. ERDA-sponsored research.

The zinc-bromine battery is a fundamentally attractive candidate for electric vehicles and load leveling owing to the use of abundant low-cost materials, its high energy density, good efficiency, and ambient temperature operation. An approach to zinc-bromine batteries is described which avoids the traditional shortcomings of rapid self-discharge and short cycle life. The major features of the approach are the use of an ion exchange membrane, optimized electrolyte composition, and electrolyte circulation. The rate of self-discharge has been decreased to 0.1% per hour, and a cycle life of at least two thousand 2.5-hour cycles at 25 ma/sq cm has been demonstrated. (Author)

**A77-48726 The design and development of a 30 kW-hr lithium-aluminum/iron sulfide electric vehicle battery.** W E Miller, V. M. Kolba, A A Chilenskas (Argonne National Laboratory, Argonne, Ill.), and K Gentry (Argonne National Laboratory, Argonne, Ill., Eagle-Picher Industries, Inc., Joplin, Mo.) In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D C., August 28-September 2, 1977, Proceedings, Volume 1 La Grange Park, Ill., American Nuclear Society, Inc., 1977, p. 256-261. 5 refs. ERDA-sponsored research

**A77-48727 Design of a current technology electric vehicle.** R H Guess, W R Nial (General Electric Co., Schenectady, N.Y.), and M A Pocobello (Triad Services, Inc., Dearborn, Mich.) In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D C., August 28-September 2, 1977, Proceedings, Volume 1 La Grange Park, Ill., American Nuclear Society, Inc., 1977, p. 262-268

The design characteristics of a four passenger electric vehicle intended for urban use are described, and the energy consumption at various steady state level vehicle speeds is portrayed. Several design components and structural features of the vehicle are discussed. Topics include the battery, battery packaging, battery charger, the propulsion subsystem, and the power conditioning unit. Structural features considered include the seating arrangement, passenger doors, front and rear suspension, and the brakes. Upgrading technology is

identified by trade-off analysis, and predicted improvements are listed. M L

**A77-48728 Flywheel module for electric vehicle regenerative braking** E L Lustenader, E Richter, F G Turnbull, J S Hickey (General Electric Co., Schenectady, N.Y.), and G Chang (ERDA, Div of Energy Storage Systems, Washington, D C) In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D C., August 28-September 2, 1977, Proceedings Volume 1 La Grange Park, Ill., American Nuclear Society, Inc., 1977, p 269-274. 9 refs

Current battery electric vehicles are limited in multi-stop-and-go driving range and accelerating capability by the lead-acid battery which cannot handle high power peaks and still maintain high energy density. A hybrid flywheel/battery system can isolate the battery from the accelerating power peaks and also recover a substantial portion of the available braking energy. This paper describes the development of a small, high speed, lightweight flywheel/a-c synchronous motor alternator sealed energy storage package coupled to a load commutated inverter power circuit. The system stores sufficient energy in the rotor of the machine for one stop-start cycle. A composite flywheel is used to store additional energy for several cycles, or enough for climbing or descending short grades. (Author)

**A77-48729 Rechargeability studies of ambient temperature lithium/sulfur batteries.** R D Rauh, G F. Pearson, and S B. Brummer (EIC Corp., Newton, Mass.) In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D C., August 28-September 2, 1977, Proceedings Volume 1 La Grange Park, Ill., American Nuclear Society, Inc., 1977, p 283-287. 22 refs. Grant No. EY-76-C-02-2520.

An ambient temperature Li/S battery of the configuration Li/Li<sub>2</sub>S(n) organic solvent/C is described, where the cathode material is totally soluble in the electrolyte. For a practical battery, the sulfur concentration must be greater than 5M. Despite the intimate contact between the Li anode and the cathode, the cell can be charged. Prototype cells have been cycled at 25 C and at 50 C. Charge and discharge rates ranged from 0.5-2.0 mA/sq cm. At least 120 low capacity cycles (0.10e(-)/S) have been demonstrated at 50 C, with an average efficiency of 95%. For a cycle depth of 0.5e(-)/S, efficiencies at 1 mA/sq cm are 95% at 25 C and 90% at 50 C. The anode cycling efficiency is, within experimental error, the same as that of the total cell. Therefore, any Li dendrites isolated on the anode during cycling are dissolved via the self-discharge reaction. This maintains the materials balance in the cell, a major requirement for its practical success. (Author)

**A77-48730 The storability of Li/SO<sub>2</sub> cells.** H. Taylor (P R. Mallory and Co., Inc., Burlington, Mass.) In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D C., August 28-September 2, 1977, Proceedings Volume 1 La Grange Park, Ill., American Nuclear Society, Inc., 1977, p 288-295. 16 refs.

Li/SO<sub>2</sub> cells have been stored for as long as five years at ambient temperatures. Particularly when they are of hermetic construction, they appear to have very good storability, not only in the inactive state, but also under continuous low-rate discharge even at elevated temperatures. Voltage start-up at low temperatures after storage extremes is minimal. Li/SO<sub>2</sub> D-cells deliver 9 Wh/cu in and 147 Wh/lb at -23 C under a 1 mA continuous drain rate. (Author)

**A77-48734 ERDA fuel cell programs.** L R. Lawrence, Jr (ERDA, Washington, D.C.) In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D C., August 28-September 2, 1977, Proceedings Volume 1 La Grange Park, Ill., American Nuclear Society, Inc., 1977, p 319-324.

Fuel cell technology and goals are discussed. A first generation 4.8 MW fuel cell power system is being planned for the purpose of demonstrating the concept viability of a large-scale fuel cell generator. This first generation system will have the capability of operating with a variety of gaseous and liquid fuels, and will be

placed in an electric utility power grid in mid-1978. The system will also be used to supersede gas-fired furnaces for space heating. A study comparing a gas-fired furnace to a fuel cell/heat pump combination, utilizing waste heat, shows a natural gas savings of 40%. It is thought that fuel cell technology can save at least 275,000 barrels of oil per day by 1985. Second generation fuel cells, which use molten carbonate, are being planned for installation in the mid-1980's. M L

**A77-48735 Advanced fuel cell technology and applications.** J. M. King, W E Houghtby, and R A Sederquist (United Technology Corp., Power Systems Div., South Windsor, Conn.) In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D C., August 28-September 2, 1977, Proceedings Volume 1 La Grange Park, Ill., American Nuclear Society, Inc., 1977, p 325-329. 5 refs.

The Advanced Technology Fuel Cell Program objective, is to establish the technology and design base for fuel cell powerplants with reduced capital cost, a 7500 BTU/kWh heat rate and fuel capability extending to Number 2 fuel oil. Molten carbonate, advanced phosphoric acid fuel cells, and advanced fuel processing concepts are being investigated and approaches to the use of coal with fuel cell powerplants are under evaluation. A low cost concept was demonstrated in a 20-cell phosphoric acid stack. Subscale molten carbonate cell performance and endurance have improved significantly. A 19-cell stack test confirmed the ability to scale molten carbonate cells. An advanced reforming laboratory rig operated stably for 1000 hours on No. 2 fuel oil with 2500 ppm sulfur. Coal-fueled concepts have been investigated for central stations. Studies indicate coal pile-to-bus bar efficiencies of 45-50% can be achieved. (Author)

**A77-48736 ERDA Fuel Cell Applied Research Program.** I L Harry (ERDA, Washington, D C.) In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D C., August 28-September 2, 1977, Proceedings Volume 1 La Grange Park, Ill., American Nuclear Society, Inc., 1977, p 330-336.

A program demonstrating the technical feasibility of a high-temperature, solid-electrolyte fuel cell is described. A typical cell uses nickel or cobalt-zirconia cermets as fuel-electrode materials, with tin-doped indium oxide the preferred air electrode material and either calcia- or yttria-stabilized zirconia as the electrolyte film. Fuel cell technology involving electrocatalysis and such advanced concepts as alternate acid electrolytes is also considered, and direct coal-air fuel cell are discussed. B J

**A77-48737 Molten carbonate fuel cell model.** D J Dharja (Energy Research Corp., Danbury, Conn.) In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D C., August 28-September 2, 1977, Proceedings Volume 1 La Grange Park, Ill., American Nuclear Society, Inc., 1977, p 337-340. Contract No. E(04-3)-1196.

A mathematical model describing the behavior of the molten carbonate fuel cell is presented. The model computes the values for dimensionless local and average current densities and fuel and oxidant conversions as a function of dimensionless fuel cell length for given cathode and anode gas compositions, temperature, ratio of fuel to oxidant flow and terminal voltage of the fuel cell. The experimental polarization curves were compared with the polarization curves generated by the model. Agreement between experiment and theory are discussed and the limits of model applications described. (Author)

**A77-48738 4.8-megawatt fuel cell module demonstrator.** L M Handley (United Technologies Corp., Power Systems Div., South Windsor, Conn.), L J Rogers (ERDA, Washington, D C.), and E Gillis (Electric Power Research Institute, Palo Alto, Calif.) In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D C., August 28-September 2, 1977, Proceedings Volume 1 La Grange Park, Ill., American Nuclear Society, Inc., 1977, p 341-348. 6 refs. Grant No. EX-76-C-01-2102.

A 4.8 MW fuel cell demonstrator powerplant is being constructed by United Technologies with support from ERDA and EPRI, to be erected and tested at a utility site starting in late 1978. The dc module is the heart of the demonstrator; its purpose is to convert hydrocarbon fuel and air into direct current. The power conditioner converts dc power from the dc module to three-phase, 60-Hz ac power at 13.8 kV. The demonstrator is controlled from a site control center, while each of the modular units includes its own controller. B J

**A77-48739** Post-test analysis of Li/FeS<sub>2</sub> compact cells. R A Murie (GM Research Laboratories, Warren, Mich.) In: Intersociety Energy Conversion Engineering Conference, 12th, Washington, D.C., August 28-September 2, 1977, Proceedings Volume 1. La Grange Park, Ill., American Nuclear Society, Inc., 1977, p. 349-358.

The Li/FeS<sub>2</sub> cell utilizing a molten salt electrolyte is being actively studied as a candidate for electric vehicle power. The post-test analysis of cells that have operated for thousands of hours supplies fundamental data on materials, corrosion, mass transfer of positive and negative electrode materials, separator effectiveness, electrode behavior and design. This paper discusses the results obtained from the post-test analysis of two compact Li/FeS<sub>2</sub> cells, CC-1 and CC-2, that operated for 10,462 and 1,733 h, respectively, primarily at 475 C. The testing of CC-1 was terminated due to shorting and loss in efficiency. The second cell, CC-2, was terminated after the failure of an external cycling system permitted an extended overdischarge to occur. (Author)

**A77-48740** Recent progress in development of sodium-sulfur battery for utility application. S. P. Mitoff, M. W. Breiter, and D. Chatterji (General Electric Co., Schenectady, N.Y.). In: Intersociety Energy Conversion Engineering Conference, 12th, Washington, D.C., August 28-September 2, 1977, Proceedings Volume 1. La Grange Park, Ill., American Nuclear Society, Inc., 1977, p. 359-367. 8 refs. Research supported by the Electric Power Research Institute.

The development of a sodium-sulfur battery system for utility applications is outlined. Experience gained with small, 16 Ah capacity test cells is discussed with particular emphasis on life and performance improvements made in recent years. Cells now operate with 80% or greater capacity utilization. The average cell efficiency is about 75%. The life of these 'metal' test cells has now increased to 12,000 test hours at 54 mA/sq cm current density and 9960 test hours at 108 mA/sq cm. These life and performance improvements are compared against the long-range goals and areas for further technological and/or cost improvements are identified. The basic features of alternative preliminary designs for the BEST battery are described to illustrate the type of design-manufacturability - cost - reliability iterations needed before arriving at the final decision. (Author)

**A77-48741** Development status of lithium-silicon/iron sulfide load leveling batteries. S. Sudar, L. A. Heredy, J. C. Hall, and L. R. McCoy (Rockwell International Corp., Atomics International Div., Canoga Park, Calif.). In: Intersociety Energy Conversion Engineering Conference, 12th, Washington, D.C., August 28-September 2, 1977, Proceedings Volume 1. La Grange Park, Ill., American Nuclear Society, Inc., 1977, p. 368-374. 9 refs. Research supported by the Argonne National Laboratory and Electric Power Research Institute.

High-temperature, molten salt batteries using lithium-silicon negative electrodes and iron sulfide positive electrodes are being developed for electric utility load-leveling use. Corrosion-resistant FeS positive electrode structures have been developed which resist deformation in use. Performance improvements in negative electrodes have been achieved with modifications of the lithium-silicon alloy. These electrodes have been incorporated into compact cells and an energy density of 79 Wh/kg has been reached. The use of powdered ceramic separators has resulted in improved cell performance and reliability. A 150-W.h cell has been operated for over 1100 cycles in a period of more than 1 year. Scaleup of these cells

has been carried out without difficulty to that of a multi-electrode cell with a capacity of 1 kWh. The present development status of these batteries is described. (Author)

**A77-48742** Improved negative electrodes for lithium/iron sulfide batteries. S.-C. Lai and A. F. Sammells (Rockwell International Corp., Atomics International Div., Canoga Park, Calif.). In: Intersociety Energy Conversion Engineering Conference, 12th, Washington, D.C., August 28-September 2, 1977, Proceedings Volume 1. La Grange Park, Ill., American Nuclear Society, Inc., 1977, p. 375-379. 7 refs.

A program for the development of lithium-silicon alloy negative electrodes for lithium/iron sulfide load-leveling batteries is being carried out. These batteries use a molten LiCl-KCl electrolyte and are operated at temperatures at 400 to 450 C. Negative electrodes have been fabricated in both the initially charged and discharged states. An additive with silicon has been found which permits these electrodes to be built in the discharged state and subsequently charged with high active material utilization. The electrochemical properties of electrodes using the modified alloy are superior to those obtained with negative electrodes using the lithium-silicon alloy alone. A problem with silicon transfer to the electrode support structure has been identified. Metal silicides formed as a result of this transfer are brittle and electrode capacity declines if lithium silicon electrodes are cycled at high (550 C) temperatures. This problem has been alleviated by further alloy modification. Metals have also been found which resist silicon attack. (Author)

**A77-48743** Energy and economic effects of residential energy conservation programs. E. Hirst and J. Carney (Oak Ridge National Laboratory, Oak Ridge, Tenn.). In: Intersociety Energy Conversion Engineering Conference, 12th, Washington, D.C., August 28-September 2, 1977, Proceedings Volume 1. La Grange Park, Ill., American Nuclear Society, Inc., 1977, p. 383-389. 14 refs. Research supported by the Federal Energy Administration and ERDA.

A detailed simulation model of residential energy consumption is used to evaluate the energy and direct economic effects of several conservation programs: appliance efficiency targets, thermal standards for new construction, and retrofit of existing housing units. Results suggest that each of these programs saves energy and saves money. For example, these programs could cut energy use in the year 2000 by 15-25% and save households \$25-\$45 billion between now and 2000. (Author)

**A77-48744** Development of the High Seasonal Performance Factor Gas Heat Pump. P. F. Swenson (Consolidated Natural Gas Co., Inc., Cleveland, Ohio) and R. K. Rose (Mechanical Technology, Inc., Ballston Spa, N.Y.). In: Intersociety Energy Conversion Engineering Conference, 12th, Washington, D.C., August 28-September 2, 1977, Proceedings Volume 1. La Grange Park, Ill., American Nuclear Society, Inc., 1977, p. 390-396.

A program aimed at the development of a high seasonal performance factor gas energized heat pump for space heating has been undertaken by Consolidated Gas and ERDA. The main feature of the HSPF (High Seasonal Performance Factor) Gas Heat Pump is a single shaft gas bearing turbomachine which uses a steam-Rankine prime mover. The auxiliaries are self-propelled, and phased heat exchange is utilized on the indoor and outdoor cores. The unit is modulated in accordance with ambient temperature and the hardware is packaged in conventional rooftop configuration. Program and system descriptions are given and attention is paid to a component design and performance and a system performance prediction. B.J.

**A77-48745** Development of a Stirling engine powered heat activated heat pump. W. L. Auxer (General Electric Co., Space Div., King of Prussia, Pa.). In: Intersociety Energy Conversion Engineering Conference, 12th, Washington, D.C., August 28-September 2, 1977, Proceedings Volume 1. La Grange Park, Ill., American Nuclear Society, Inc., 1977, p. 397-401.

A 3-ton heat activated heat pump, employing a natural gasified Stirling engine to drive the vapor compressor is being developed. This Stirling engine/Rankine cycle refrigeration loop concept would consume about one-half the gas required by conventional space heating equipment, and offers an efficient and competitive means of providing summer cooling, thus tending to equalize the summer-winter gas loads. A functional description (with functional diagram and component definition) of the heat pump is given and system performance is predicted (Author)

**A77-48748** Free-piston heat pumps G. M. Benson (ERG, Inc., Oakland, Calif.) In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D C, August 28-September 2, 1977, Proceedings Volume 1 La Grange Park, Ill., American Nuclear Society, Inc., 1977, p. 416-425 18 refs.

This paper summarizes ERG's work on free-piston thermal-engine-driven heat pumps which operate on the following engine/heat pump cycles: Otto/Rankine, Diesel/Rankine, Brayton/Rankine, Rankine/Rankine, Stirling/Stirling, Stirling/Rankine and Ericsson/Ericsson. Of these machines the Stirling/Rankine and Ericsson/Ericsson offer the most potential. The Ericsson/Ericsson machine is preferred, owing to its self-modulating capacity that is independent of evaporator and condenser temperatures and its high COP that exceeds vapor-compression heat pumps. These features, together with its ability to co-generate electricity, through use of an integral linear alternator, and its potential to use solar or fossil fuel (including coal), offer promise for substantial energy conservation (Author)

**A77-48750** Energy-efficient desiccant drying/dehumidification using solar or fossil fuel energy. S. M. Ko and D. V. Merrifield (Lockheed Missiles and Space Co., Inc., Huntsville, Ala.) In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D C, August 28-September 2, 1977, Proceedings Volume 1 La Grange Park, Ill., American Nuclear Society, Inc., 1977, p. 434-441 14 refs. Contract No. E(40-1)-5157

The regenerated desiccant crop drying concept is technically feasible and is capable of achieving a drying efficiency of approximately twice that of conventional crop drying systems. When using a fossil fuel energy source, energy savings will be approximately 40 to 50%. With solar energy input, the total fossil fuel savings can be 70 to 90%. As with other new energy conserving systems that are presently capital-intensive, the economic viability of the system will be dependent on future capital cost reductions, on the future price of fossil fuels, and on the specific application of the system. Regarding agricultural applications, it was concluded that the regenerated desiccant drying system, with or without the use of solar energy, will be economically best suited for a large central processing application, where it can receive a maximum amount of use and will benefit from economy-of-scale cost considerations (Author)

**A77-48751** Feasibility study of an Integrated Energy/Utility System at the University of Florida. E. F. Cox (Applied Energy Sciences, Inc., Atlanta, Ga.), D. W. Kirmse (Florida University, Gainesville, Fla.), and S. B. Manyimo (Reynolds, Smith and Hills, Jacksonville, Fla.) In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D C., August 28-September 2, 1977, Proceedings Volume 1 La Grange Park, Ill., American Nuclear Society, Inc., 1977, p. 442-448 NBS-sponsored research

An Integrated Energy/Utility System (IUS) provides conservation of fuel and water by the integration of utility systems which serve the community. Complete integration in an IUS is achieved by the addition to onsite power generation of solid waste incineration with heat recovery, water supply treatment, and sewage treatment. Treated effluent may also be used for several purposes such as cooling tower makeup, plant makeup, and irrigation. The technical feasibility and economic benefits of an IUS at the University of Florida were analyzed along with environmental and institutional factors. The results of this study project a savings in purchased energy of 44% or \$4,000,000 annually. B. J.

**A77-48752** Energy savings through on-site fuel cells in industrial applications. G. E. Voelker (ERDA, Fuel Cell Branch, Washington, D.C.) and P. Bolan (United Technologies Corp., Power Systems Div., Farmington, Conn.) In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D C, August 28-September 2, 1977, Proceedings Volume 1 La Grange Park, Ill., American Nuclear Society, Inc., 1977, p. 456-460

Cogeneration with electric generating equipment located at or near the load rather than centrally sited can provide important means of conserving energy resources. The energy savings which could be achieved in certain industrial applications by use of on-site fuel cell powerplants have been examined. Twelve industrial processes were selected for study. A fuel cell system was specified for each of the twelve selected industrial processes and energy resource consumption was determined in each case. Eleven of the twelve applications used recovered heat as well as the electricity produced by the fuel cell. In six cases, process by-product fuel was used and in four processes direct current electricity was provided. When compared with traditional energy resource consumption in each process, significant potential savings were found in all cases. In five of the processes studied, savings exceeded 20%. Overall, for the twelve processes investigated, extensive use of on-site fuel cell systems could result in resource savings of 190,000 barrels of oil (equivalent) per day (Author)

**A77-48753** The photosynthesis energy factory - Analysis, synthesis, and demonstration. G. C. Szego, M. D. Fraser, C. H. Harmer, J. F. Henry, W. B. Scholten, C. W. Vail (InterTechnology/Solar Corp., Warrenton, Va.), W. J. Oswald, and J. R. Benemann (California University, Berkeley, Calif.) In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D C, August 28-September 2, 1977, Proceedings Volume 1 La Grange Park, Ill., American Nuclear Society, Inc., 1977, p. 461-468 9 refs. Contract No. E(49-18)-2548

The Photosynthesis Energy Factory is a synergistic combination of the dry land Energy Plantation and an algae production system which can produce, on a perpetually renewable basis, unpolluting and totally domestic fuels from solar energy and various residues. From the Energy Plantation, woody plant matter is produced which is chipped and used as a solid fuel in a power plant to produce electricity. The algae production system uses the nutrients in wastewater and the CO<sub>2</sub> in power plant flue gas to produce algae, which are harvested and ultimately digested anaerobically to produce methane. Digester sludge is disposed of in a beneficial way by being put onto the Energy Plantation. A comprehensive techno-economic model is being developed for a systems analysis. Potential sites for a demonstration project are being analyzed and selected. The final task in this project is to develop a preliminary design and associated cost estimates for a proposed demonstration (Author)

**A77-48755** Biphasic turbines for diesel bottoming. L. Hays (Biphasic Engines, Inc., Santa Monica, Calif.) and J. Neal (ERDA, Washington, D C) In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D C, August 28-September 2, 1977, Proceedings Volume 1 La Grange Park, Ill., American Nuclear Society, Inc., 1977, p. 473-481. 9 refs.

Application of a two-phase turbine system to waste heat recovery was examined. Bottoming cycle efficiencies ranging from 15-30% were calculated for a 720 F diesel exhaust temperature. A single stage demonstration unit, designed for nontoxic fluids (water and Dowtherm A) and for atmospheric seals and bearings, had a cycle efficiency of 23%. The net output power was 276 HP at 8000 rpm, increasing the total shaft power from 1800 HP for the diesel alone, to 2076 HP for the combined system. A four stage organic turbine, for the same application, had a rotational speed of 14,700 rpm while a four stage steam turbine had 26,000 rpm. An additional reduction in capital cost was found to result from the use of a contact heat exchanger instead of tube-fin construction. The cost of a contact heat exchanger was only \$35-52/kWe compared to \$98/kWe for a tube-fin heat exchanger. The major improvement leading to higher cycle efficiency and lower turbine rpm was found to be the use of a liquid component with lower sensible heat (Author)

**A77-48756** Performance of absorption cycle operating with low thermal-potential energy sources for direct-contact cooling applications. I Borde, I Yaron, and M Jelinek (Negev, University, Beersheba, Israel). In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D C, August 28-September 2, 1977, Proceedings Volume 1 La Grange Park, Ill, American Nuclear Society, Inc., 1977, p 482-488 5 refs

Low thermal-potential energy sources, e.g., waste heat, solar energy, etc., can be utilized for refrigeration or cooling in various industrial applications. Suitable working solutions have been selected to operate in an absorption refrigeration cycle. A computer program delineated the ranges of feasible operating parameters and chose the optimal operating conditions for given energy sources, refrigeration requirements and ambient conditions. The effects of various parameters upon the coefficient of performance and the circulation ratio of the system were investigated. With Freon 22 as refrigerant, the feasibility has been demonstrated of obtaining efficient cooling by direct-contact evaporation. Specific fields of application are indicated (Author)

**A77-48758** Heat pipes for hostile environments in energy conservation applications. A Basulis and G I. Ewell (Hughes Aircraft Co., Torrance, Calif.) In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D C, August 28-September 2, 1977, Proceedings Volume 1 La Grange Park, Ill, American Nuclear Society, Inc., 1977, p 493-497

Heat pipes offer many advantages for potential use in energy recovery applications: unrestricted form factor, large choice of materials and material combinations, and each heat pipe can operate independently or in concert with other heat pipes in the heat recovery unit. A program was initiated to develop heat pipes for hostile environments such as sulfur plants and coal gasifiers. Heat pipe materials and potential coatings were evaluated for corrosive and abrasive environments from 200 C to 600 C. This study indicated that heat pipes can be designed and built for heat recovery, but compatibility data in the environment was lacking, and that field test data is badly needed. A heat pipe test vehicle for data acquisition was designed, fabricated, and bench model tests have been completed. A test vehicle is ready for field tests in sulfur plants and coal gasifiers (Author)

**A77-48759** Exact 60 cycle power generation at any speed. R T Morash (Precise Power Corp., Bradenton, Fla.) In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D C, August 28-September 2, 1977, Proceedings Volume 1 La Grange Park, Ill, American Nuclear Society, Inc., 1977, p 498-504 10 refs

A new electrical power generator produces any exact frequency, at any shaft rpm. The speed can vary over a wide range without affecting the output frequency or voltage. This capability has been developed on operating units for precise frequency converters and flywheel energy storage units in uninterruptible power systems. Other useful applications are: 60 cycle power directly from a varying speed windmill shaft, auxiliary power take-off from a mobile unit, variable speed prime mover, up-rating diesel-generator sets by allowing the diesel to run at optimum design speeds, energy conservation in on-site or small power systems by using variable speed to match load requirement, precise power for portable or remote locations such as geodetic survey work or video applications, unusual frequency requirements, and simple parallel operation of numerous generators producing identical frequency. A typical unit is described. Units from Kilowatt to Megawatt sizes can be built. (Author)

**A77-48760** The design of a sodium sulfate decahydrate heat exchanger for coolness storage. S Kumar and F A Costello (InterTechnology Solar Corp., Warrenton, Va.) In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D C, August 28-September 2, 1977, Proceedings Volume 1 La Grange Park, Ill, American Nuclear Society, Inc., 1977, p 511-516

The use of a mixture of salts for coolness storage is analyzed with attention to the effects of different salt mixture and heat

exchange configurations. The enthalpy-temperature relationship of the mixture was obtained experimentally, and this relationship was used to solve the differential equations characterizing the performance of the salt under dynamic conditions. The differential equations are solved for several heat exchanger geometries of practical interest. Solutions to the differential equations are combined so the overall performance of the heat-storage heat exchanger can be estimated. The resulting equations are useful in predicting the temperature history of air exiting from the heat exchanger as a function of time and as a function of the inlet conditions to the heat exchanger. M.L.

**A77-48761** Energy storage - An interference assembled multiring superflywheel. J A Kirk and R A Huntington (Maryland, University, College Park, Md.) In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D C, August 28-September 2, 1977, Proceedings Volume 1 La Grange Park, Ill, American Nuclear Society, Inc., 1977, p 517-524. 23 refs

A stress analysis and energy density maximization procedure has been developed for improving the performance of multiring composite material flywheels. The procedure utilizes interference assembly between individual flywheel rings and causes a redistribution of centrifugal stresses. An example of a multiring magnetically suspended flywheel is considered and significant gains in rotor performance are shown to be possible (Author)

**A77-48762** Conversion and storage of wind energy as nitrogenous fertilizer. M Dubey (Lockheed-California Co., Burbank, Calif.) In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D C, August 28-September 2, 1977, Proceedings Volume 1 La Grange Park, Ill, American Nuclear Society, Inc., 1977, p 525-532 6 refs NSF Grant No C-75-22186

The use of wind energy, air, and water to produce ammonia for use as a nitrogenous fertilizer is discussed. A study shows that it is technologically feasible to reduce the scale of an ammonia processing plant to produce a tiny fraction of the output rates of full scale commercial plants. Such a system can be adequately powered by a wind turbine driving an electrolysis cell to produce the required hydrogen feedstock. The process is described, and several factors, such as energy storage, product storage, and energy balance and component matching, are considered. The economics of the system are analyzed, and it is thought that the cost of the produced fertilizer will be competitive if natural gas prices continue to rise. M L

**A77-48763 \*** ERDA's Chemical Energy Storage Program. J H Swisher (ERDA, Div of Energy Storage Systems, Washington, D C) and J H Kelley (California Institute of Technology, Jet Propulsion Laboratory, Pasadena, Calif.) In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D C, August 28-September 2, 1977, Proceedings Volume 1 La Grange Park, Ill, American Nuclear Society, Inc., 1977, p 533-539 10 refs

The Chemical Energy Storage Program is described with emphasis on hydrogen storage. Storage techniques considered include pressurized hydrogen gas storage, cryogenic liquid hydrogen storage, storage in hydride compounds, and aromatic-alicyclic hydrogen storage. Some uses of energy storage are suggested. Information on hydrogen production and hydrogen use is also presented. Applications of hydrogen energy systems include storage of hydrogen for utilities load leveling, industrial marketing of hydrogen both as a chemical and as a fuel, natural gas supplementation, vehicular applications, and direct substitution for natural gas. M L

**A77-48764** High temperature thermal energy storage system, Na<sub>2</sub>SO<sub>4</sub> + SO<sub>3</sub> reversibly yields Na<sub>2</sub>S<sub>2</sub>O<sub>7</sub>. R S Hockett and R W Serth (Monsanto Research Corp., Dayton, Ohio) In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D C, August 28-September 2, 1977, Proceedings Volume 1 La Grange Park, Ill, American Nuclear Society, Inc., 1977, p 540-546 7 refs

A preliminary process design is presented for a thermal energy storage system based on the reversible thermal decomposition of sodium pyrosulfate. A thermodynamic analysis of the system operating in conjunction with a conventional Rankine steam power cycle is presented, and the materials and volume requirements of the storage system are determined. A number of fundamental problems which must be resolved in order to demonstrate the technical feasibility of the concept are identified and discussed. (Author)

**A77-48765 \*** Molten salt thermal energy storage for utility peaking loads. A Ferrara, R Haslett (Grumman Aerospace Corp., Bethpage, N.Y.), and J Joyce (NASA, Lewis Research Center, Cleveland, Ohio). In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D.C., August 28-September 2, 1977, Proceedings Volume 1. La Grange Park, Ill., American Nuclear Society, Inc., 1977, p. 547-554. 6 refs.

This paper considers the use of thermal energy storage (TES) in molten salts to increase the capacity of power plants. Five existing fossil and nuclear electric utility plants were selected as representative of current technology. A review of system load diagrams indicated that TES to meet loads over 95% of peak was a reasonable goal. Alternate TES heat exchanger locations were evaluated, showing that the stored energy should be used either for feedwater heating or to generate steam for an auxiliary power cycle. Specific salts for each concept are recommended. Design layouts were prepared for one plant, and it was shown that a TES tube/shell heat exchanger system could provide about 7% peaking capability at lower cost than adding steam generation capacity. Promising alternate heat exchanger concepts were also identified. (Author)

**A77-48767** Investigation of metal fluoride thermal energy storage materials. J. L. Eichelberger and H. D. Gillman (Pennwalt Corp., King of Prussia, Pa.). In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D.C., August 28-September 2, 1977, Proceedings Volume 1. La Grange Park, Ill., American Nuclear Society, Inc., 1977, p. 567-574. 16 refs. Grant No. EY-76-C-02-2990.

Storage of thermal energy in the 400-1000 C range is attracting increasing consideration for use in solar power, central power, vehicular and commercial process systems. This study investigates the practicality of using metal fluorides as the heat storage media. The projected availability of metal fluorides has been studied and is shown to be adequate for wide-spread thermal storage use. Costs are projected and discussed in relation to thermal energy storage applications. Phase diagrams, heats of fusion, heat capacities, vapor pressures, toxicity, stability, volume changes, thermal conductivities, fusion kinetics, corrosion, and container materials of construction for a wide range of fluorides have been examined. Analyses of these data in consideration of thermal energy storage requirements have resulted in selection of the most cost-effective fluoride or fluoride mixture for each of 23 temperature increments between 400 and 1000 C. Thermophysical properties of these 23 materials are presented. (Author)

**A77-48768** Safety considerations for high temperature thermal energy storage in fluoride salts. O. Boser (North American Philips Laboratories, Briarcliff Manor, N.Y.). In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D.C., August 28-September 2, 1977, Proceedings Volume 1. La Grange Park, Ill., American Nuclear Society, Inc., 1977, p. 575-582. 12 refs.

The safety aspects of thermal energy storage at high temperatures in fluoride mixtures were studied. An experimental thermal energy storage unit is described, and the prevention of corrosion of the stainless steel container by doping the fluorides with aluminum is discussed. Experiments that illustrate the fire hazard of molten fluorides are described. No chemical reactions with various materials, including materials to extinguish fires, were observed. The fluoride mixture was found to dissolve in water at a rate of 2.6 g per 100 ml of water which is less than the 4 g per 100 ml of water of pure NaF. In addition, specimens were ruptured to simulate the situation in the case of residential home heating and automotive propulsion. In the

first case only fluorides were used. In the second case fluorides and sodium were combined, the latter simulating the heat pipe. It was found that sodium has to be contained safely, whereas the fluorides are very stable and do not react with insulation material. (Author)

**A77-48769** Large-scale thermal storage in rock - Construction, utilization, and economics. M. P. Hardy, V. D. Albertson, T. P. Bligh, M. Riaz, and P. L. Blackshear (Minnesota, University, Minneapolis, Minn.). In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D.C., August 28-September 2, 1977, Proceedings Volume 1. La Grange Park, Ill., American Nuclear Society, Inc., 1977, p. 583-590. 15 refs. Grant No. EY-76-S-02-4002.

The performance, design constraints, construction methods, and economics of a large-scale rock bed heat accumulator capable of providing 300 MWt at high temperatures (250 to 500 C) for up to 6 months are discussed. Six construction schemes are identified and compared in relation to siting requirements, land use, ground water interaction, rock quality, and construction cost. Examples are given of the effect of construction cost, construction period and plant life on the present worth of stored energy. For the assumed operating conditions this present worth of stored energy is less than 15 mills/kWh, thus making the concept of a rock bed accumulator economically attractive for long-term storage. (Author)

**A77-48770** Conceptual design of underground compressed air storage electric power systems. A. J. Gramont, R. D. Lessard (United Technologies Research Center, East Hartford, Conn.), and M. J. Hobson (Acres American, Inc., Buffalo, N.Y.). In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D.C., August 28-September 2, 1977, Proceedings Volume 1. La Grange Park, Ill., American Nuclear Society, Inc., 1977, p. 591-598. 13 refs.

Conceptual design studies have been conducted to identify Compressed Air Energy Storage (CAES) systems which are potentially attractive for future electric utility load-leveling applications. The CAES concept consists of compressing air during off-peak periods, underground storage, followed by heating and expansion through turbines to generate power. By using off-peak electricity for compression and stored air for peak load generation, the resulting oil consumption would be about 40 percent of that consumed by conventional peaking plants. Equipment requirements could be met using existing turbomachinery with relatively modest modifications. The present study focused on air storage in hydraulically compensated hard-rock caverns. Conventional underground excavation technology could be used to construct these caverns, and sufficient siting opportunities exist in the North Central and Northeast regions of the US. (Author)

**A77 48771** Improved systems for energy conversion and conservation as pollution control alternatives - USEPA program. H. E. Bostian, H. S. Skovronek, and R. E. Mournighan (US Environmental Protection Agency, Industrial Environmental Research Laboratory, Cincinnati, Ohio). In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D.C., August 28-September 2, 1977, Proceedings Volume 1. La Grange Park, Ill., American Nuclear Society, Inc., 1977, p. 600-606. 7 refs.

This paper is an overview of a USEPA research program on energy conversion and conservation. The program emphasis is on environmental problems or benefits of more efficient energy systems or ones using more abundant domestic energy resources. More efficient energy systems can generally be considered as environmentally attractive alternatives but their relative environmental-economic benefits need to be determined. On the other hand, some systems could have unique pollution control problems because of different operating conditions, use of higher sulfur fuels and feedstocks, or possible generation of hazardous pollutants. The program coverage includes the environmental aspects of waste energy utilization and other energy conservation measures, advanced power systems such as magnetohydrodynamics, ones using high temperature turbines, and solar and geothermal energy conversion. (Author)

**A77-48772**      **Pollution control in geothermal energy.** R. P. Hartley (U S Environmental Protection Agency, Industrial Environmental Research Laboratory, Cincinnati, Ohio) In: Intersociety Energy Conversion Engineering Conference, 12th, Washington, D.C., August 28-September 2, 1977, Proceedings Volume 1

La Grange Park, Ill., American Nuclear Society, Inc., 1977, p. 607-613, 11 refs.

Pollution problems will occur in geothermal energy development because large volumes of spent geothermal fluid will be released, potentially contaminating the air, surface waters, and ground waters. Waters may be highly saline and contain metals in hazardous concentrations. Noncondensable gases are of greatest concern in air discharges. The principal anticipated liquid disposal method is reinjection to the producing reservoir, for which reliable technologies must be developed. Water treatment for surface discharge could be possible but costly, although minerals recovery might be off-setting in some cases. The principal air pollutant of concern is hydrogen sulfide although such constituents as ammonia, radon, and mercury may also be significant. Considerable development and demonstration is under way for hydrogen sulfide removal. Resource characterization data are not yet sufficient to predict the full range of potential pollution problems, particularly for the widespread and variable liquid-dominated resource. (Author)

**A77-48773**      **Environmental impact of major solar power development.** D. R. Sears, M. G. Gandel (Lockheed Missiles and Space Co., Huntsville, Ala.), R. P. Hartley (U S Environmental Protection Agency, Cincinnati, Ohio), and W. G. Bradley (Environmental Consultants, Inc., Las Vegas, Nev.) In: Intersociety Energy Conversion Engineering Conference, 12th, Washington, D.C., August 28-September 2, 1977, Proceedings Volume 1

La Grange Park, Ill., American Nuclear Society, Inc., 1977, p. 614-620, 15 refs. U.S. Environmental Protection Agency Contract No. 68-02-1331

We have examined the environmental effects of terrestrial silicon photovoltaic power generation in utility application, by following the chain of events from raw material extraction to plant operation. CdS and GaAs technology, satellite siting, and solar steam-electric plants are also discussed briefly. (Author)

**A77-48775**      **Impact of air quality regulation on the electric power industry.** K. Yeager (Electric Power Research Institute, Palo Alto, Calif.) In: Intersociety Energy Conversion Engineering Conference, 12th, Washington, D.C., August 28-September 2, 1977, Proceedings Volume 1

La Grange Park, Ill., American Nuclear Society, Inc., 1977, p. 637-645

The paper will consider several emerging trends in air pollution regulations and legal interpretations of the Clean Air Act which have major impact on the electric utility industry. Foremost among these trends is the shift from health and welfare based ambient air quality regulations to an administration definition of 'Best Available Control Technology' (BACT) as the primary mechanism for air quality change. The paper will specifically analyze BACT in terms of the technologies required in the time frame of 1977-1990, together with their costs and operating implications for the electric utility industry. Since the BACT concept forms the basis for several regulatory applications to the electric utility industry, its technological and economic implications will be analyzed in terms of a strategy which is not only the least costly but the only one consistent with available supplies of domestic fuel and control technology. (Author)

**A77-48776**      **Development status and environmental hazards of several candidate advanced energy systems.** M. M. Penny, S. V. Bourgeois (Lockheed Research Engineering Center, Huntsville, Ala.), and W. C. Cain (U S Environmental Protection Agency, Industrial Environmental Research Laboratory, Cincinnati, Ohio) In: Intersociety Energy Conversion Engineering Conference, 12th, Washington, D.C., August 28-September 2, 1977, Proceedings Volume 1

La Grange Park, Ill., American Nuclear Society, Inc., 1977, p. 646-654, 25 refs. U.S. Environmental Protection Agency Contract No. 68-02-1331

This paper presents a review of the development status and anticipated primary environmental hazards of nine advanced energy systems. A summary of federally-funded R&D for these energy systems is also presented. Each of these energy systems has a negligible or mild direct environmental impact when compared with conventional fossil fuel and nuclear systems. Indirect impacts for some of the energy systems could be severe, however, and these systems need further study to quantify their impacts. Considering both expected environmental impact and period of technology breakthrough/commercialization, the systems are ranked in order of decreasing research priority as follows: high temperature turbines, ocean thermal gradients, windmills, magnetohydrodynamics, metal vapor Rankine topping cycles, hydrogen fuel cells, thermionics, electrogasdynamics and thermoelectric conversion. (Author)

**A77-48777**      **Environmental considerations in advanced energy conversion technology assessments.** H. Shaw (Exxon Research and Engineering Co., Linden, N.J.) and W. C. Cain (U S Environmental Protection Agency, Cincinnati, Ohio) In: Intersociety Energy Conversion Engineering Conference, 12th, Washington, D.C., August 28-September 2, 1977, Proceedings Volume 1

La Grange Park, Ill., American Nuclear Society, Inc., 1977, p. 655-661, 9 refs. U.S. Environmental Protection Agency Contract No. 68-02-2146

The potential environmental problems of advanced energy conversion technologies are being assessed in a three-phase, 30-month program in order to provide information to help plan for solutions during development rather than retrofitting control equipment after these technologies become a commercial reality. The advanced cycles being considered in this program include: open and closed cycle MHD, open and closed cycle gas turbines, liquid metal topping cycles, supercritical CO<sub>2</sub> cycles, fuel cells, advanced steam cycles, and bottoming cycles. The Phase I effort (first year) consolidated the available information on potential pollutants. Phase II (currently under way) will develop models and engineering assessments in order to estimate effluents, pollutants, and waste energy. Phase III will use all the information generated in the program to identify the critical R&D needed to make these technologies environmentally acceptable. (Author)

**A77-48778**      **Environmental assessment of advanced energy conversion technologies.** A. D. Carmichael, J. F. Louis, J. D. Teare, and S. E. Tung (MIT, Cambridge, Mass.) In: Intersociety Energy Conversion Engineering Conference, 12th, Washington, D.C., August 28-September 2, 1977, Proceedings Volume 1

La Grange Park, Ill., American Nuclear Society, Inc., 1977, p. 662-669, 8 refs.

The paper presents a summary of results of an assessment of the environmental implications of various advanced energy conversion technologies. The overall goal requires modeling of all pollution emission aspects of selected cycles, with consideration of the entire process from raw materials (including fuel) delivered at the plant site to exit of all gaseous, liquid and solid material and energy wastes. This modeling must include the effects attributable to higher temperature and additional cycle complexities compared with those used in conventional power plants. Work reported to date includes thermodynamic evaluation and assessment of selected advanced energy conversion systems, including almost all of the ECAS cycles, plus the Field cycle and the thermionic conversion topping cycle. Examples discussed in the paper include the two latter, and the open cycle MHD topping system. (Author)

**A77-48779**      **A comparison of the environmental impact of conventional and fluid bed boilers in advanced steam power plants.** C. E. Jahng and H. Shaw (Exxon Research and Engineering Co., Linden, N.J.) In: Intersociety Energy Conversion Engineering Conference, 12th, Washington, D.C., August 28-September 2, 1977, Proceedings Volume 1

**A77-48780**      **An environmental assessment of liquid metal topping cycles.** C. E. Jahng and H. Shaw (Exxon Research and

Engineering Co., Linden, N.J.) In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D.C., August 28-September 2, 1977, Proceedings Volume 1 La Grange Park, Ill., American Nuclear Society, Inc., 1977, p 675-680 12 refs US Environmental Protection Agency Contract No 68-02-2146

The operation and process flow plan of a liquid potassium topping cycle applied to a conventional utility furnace (CF) and to a pressurized fluid bed (PFB) combustor are described, and the environmental effects of the topping cycle are evaluated. Potassium topping allows a 19% saving in coal consumption together with a 29% decrease in size of the steam, cooling water, and water makeup systems compared to PFB systems without topping. When applied to a base case conventional steam power plant, topping saves 18% in coal and 32% in the steam and water systems. Topping has little effect on emissions when based on heat input or coal consumed, but does improve station efficiency and decrease emissions on an energy output basis. The main environmental danger is the possible formation of KOH fumes in the event of a potassium boiler tube failure, so that scrubbers may be needed P T H

**A77-48781** An environmental assessment of a 638 MWe molten carbonate fuel cell power plant. C D. Kalfadelis, G Cirpios, H H Horowitz, and H Shaw (Exxon Research and Engineering Co., Linden, N.J.) In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D.C., August 28-September 2, 1977, Proceedings Volume 1 La Grange Park, Ill., American Nuclear Society, Inc., 1977, p 681-688 16 refs US Environmental Protection Agency Contract No 68-02-2146.

The potential pollution associated with a conceptual base load molten carbonate fuel cell power plant was assessed. The assessment was based on the system design prepared as part of the ERDA/NASA/NSF Energy Conversion Alternatives Study (ECAS). Air pollution is not expected to be a problem. NO<sub>x</sub> produced from air fixation is minimal in this system due to the low temperature of operation (700-750 C). Sulfur is removed from the synthesis gas immediately after coal gasification, and thus is not a problem associated with the steam plant. The major environmental problems are seen to be associated with ash handling and disposal from gasification, and with water treatment and cooling tower operation for the steam plant. In the ECAS program, the cost of electricity was estimated to be 2.87 cents/kWh (mid-1975). Our estimate is 4.4 cents/kWh, primarily due to higher calculated capital requirements (Author)

**A77-48782** Pressurized fluidized bed pilot plant for production of electric power using high sulfur coal. S Moskowitz (Curtiss-Wright Corp., Wood-Ridge, N.J.) and G Weth (ERDA, Washington, D.C.) In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D.C., August 28-September 2, 1977, Proceedings Volume 1 La Grange Park, Ill., American Nuclear Society, Inc., 1977, p 696-703

This paper describes the five year, multi-phase program which is under way for the design, construction, and operation of a pilot electric power plant producing an equivalent of 13 MW to demonstrate the concept of a gas turbine integrated with a PFB coal combustion system. The development program will address to key technical questions including PFB and turbine durability, maintenance, reliability and environmental acceptability. Unique in this PFB system is the use of 1/3 of the turbine compressor air to fluidize the bed and support combustion, with the remaining 2/3 used to control bed temperature and extract heat through an in-bed gas-to-air heat exchanger. In addition to a two stage hot gas cleanup system, transpiration-air protected turbine blading will be used to prevent erosion, corrosion, and deposition in the turbine (Author)

**A77-48783** Coal fired combined cycle for electric power generation. R D Brooks, J R Peterson (General Electric Co., Schenectady, N.Y.), and G Weth (General Electric Co., Schenectady, N.Y., ERDA, Washington, D.C.) In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D.C., August 28-September 2, 1977, Proceedings Volume 1 La

Grange Park, Ill., American Nuclear Society, Inc., 1977, p 704-711 17 refs

The Coal Fired Combined Cycle (CFCC) is the unique power plant concept which when developed will provide a direct coal-burning gas turbine and steam turbine combined cycle suitable for base load application. The combined cycle operation offers the potential for improved efficiency, and pressurized fluidized bed combustion will provide substantial improvements in lowering the emissions of coal-burning plants for the electric utility industry. The CFCC approach provides cooling of the fluid bed combustor through the use of steam tubes in the bed which supply high pressure, high temperature steam to a conventional steam turbine-generator. Combustion gases are expanded through heavy duty gas turbines which pressurize the combustor and generate additional electric power (Author)

**A77-48784** Fluidized bed adiabatic combustor power plants - Concepts and comparisons. J R Hamm, D L Kearns, and D H Archer (Westinghouse Research and Development Center, Pittsburgh, Pa.) In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D.C., August 28-September 2, 1977, Proceedings Volume 1 La Grange Park, Ill., American Nuclear Society, Inc., 1977, p 712-717 6 refs

**A77-48785** The solid-fuel gas turbine for industrial energy production. F R Wocasek and D R Moody (Combustion Power Co., Inc., Menlo Park, Calif.) In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D.C., August 28-September 2, 1977, Proceedings Volume 1 La Grange Park, Ill., American Nuclear Society, Inc., 1977, p 718-724 5 refs

Steadily increasing costs for energy have spurred a search for new methods of generating energy from low-cost abundant fuels. The development of a gas turbine system that can utilize wood waste in direct combustion is currently in progress. A 1-mW pilot plant has demonstrated the basic concept of the gas turbine and fluid-bed combustion. Areas that are under active development are the control of deposition and corrosion due to process chemistry and erosion control by particulate filtration. Cycle trends of the prospective systems are presented as well as possible configurations for the forests products industry (Author)

**A77-48786** A unitized 500-megawatt fluidized bed boiler design. S L Darling (Combustion Engineering, Inc., Windsor, Conn.) and R H Tourin (New York State Energy Research and Development Authority, New York, N.Y.) In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D.C., August 28-September 2, 1977, Proceedings Volume 1 La Grange Park, Ill., American Nuclear Society, Inc., 1977, p 725-730. Research supported by the Electric Power Research Institute and New York State Energy Research and Development Authority

The design concept for a 500 MW fluidized bed boiler consisting of a single unit instead of the usual modular type is proposed. The total bed plan area installed in the boiler is 558 sq m. Two types of beds are used: the main beds and the carbon burn up cell beds. The boiler efficiency is 89.7% P T H

**A77-48787** Analysis of power cycles with centrifugal fluidized bed coal combustion. W J Shakespeare, E K Levy, J C Chen, and V Kadambi (Lehigh University, Bethlehem, Pa.) In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D.C., August 28-September 2, 1977, Proceedings Volume 1 La Grange Park, Ill., American Nuclear Society, Inc., 1977, p 731-736 11 refs. Research supported by the Pennsylvania Science and Engineering Foundation, Pennsylvania Power and Light Co., and NSF

Results on the effects of important operating parameters on the thermodynamic efficiencies of a steam cycle and a combined cycle using adiabatic centrifugal fluidized bed combustors are presented and compared to the performance obtained for three power cycles using conventional fluidized bed combustors and for a pulverized

coal power plant with limestone scrubbing. Electrical energy costs are calculated for each cycle for 600, 300 and 30 MWe power plants operating at 65 and 25 percent capacity factors (Author)

**A77-48788 Pressurized fluidized-bed coal combustion** R C Hoke (Exxon Research and Engineering Co., Linden, N.J.) In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D.C., August 28-September 2, 1977, Proceedings Volume 1 La Grange Park, Ill., American Nuclear Society, Inc., 1977, p. 737-742. US Environmental Protection Agency Contract No. 68-02-1312

The pressurized fluidized bed combustion of coal was studied in a program sponsored by the U.S. Environmental Protection Agency (EPA). Emission of sulfur dioxide, nitrogen oxides and other components in the combustor flue gas, carbon combustion efficiency and heat transfer coefficients were measured as a function of combustor operating conditions. A process design was developed incorporating the estimation of sorbent requirements and boiler design criteria needed to meet EPA emission standards for sulfur dioxide and nitrogen oxides (Author)

**A77-48789 Development of the fluidized-bed carbon-burnup cell** R R Reed (Pope, Evans and Robbins, Inc., Alexandria, Va.) In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D.C., August 28-September 2, 1977, Proceedings Volume 1 La Grange Park, Ill., American Nuclear Society, Inc., 1977, p. 743-750

The ability to burn the high carbon content fly ash produced by atmospheric fluidized-bed boilers is a prerequisite for attaining overall high combustion efficiencies necessary for utility size power plants. A test program using a multiple point fly ash feeder with a 0.7 m squared cross-section combustor was conducted to further develop the fly ash combustion system. Combustion efficiency over a range of operating variables was determined. High combustion efficiencies in small combustors with only one feed point were found. These tests are part of a program to design, build and operate a 30 MW Multicell Fluidized-Bed Boiler as a pollution-free method of burning high-sulfur coal in a utility application (Author)

**A77-48790 Reducing the environmental impact of solid wastes from a fluidized-bed combustor** I Johnson, G J Vogel, J Montagna, J Shearer, R Snyder, W Swift, and A A Jonke (Argonne National Laboratory, Argonne, Ill.) In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D.C., August 28-September 2, 1977, Proceedings Volume 1 La Grange Park, Ill., American Nuclear Society, Inc., 1977, p. 751-757. 16 refs

The use of three options for the reduction of the environmental impact of solid sorbents used to control SO<sub>2</sub> emission in fluidized-bed coal combustion systems has been experimentally examined. The three options are: (1) the use of agents such as NaCl to enhance the chemical reactivity of sorbents, (2) regeneration and reuse of limestone, and (3) the use of synthetic sorbents. The quantity of waste generated decreases in the order (1) to (3), the cost increases in the order (1) to (3). At present, both the use of chemical enhancement agents and the regeneration of limestone (or dolomite) appear to be viable options. The high cost, the low SO<sub>2</sub> capacity, and the small decrease in environmental impact obtainable with synthetic sorbents at the present state of development eliminate this option from future consideration (Author)

**A77-48792 Dynamic modeling of fluidized bed boilers for control system design** D A Berkowitz (Mitre Corp., Bedford, Mass.) In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D.C., August 28-September 2, 1977, Proceedings Volume 1 La Grange Park, Ill., American Nuclear Society, Inc., 1977, p. 765-771. 12 refs. Contract No. E(49-18)-2453

Mathematical modeling techniques applicable to the characterization of fluidized-bed combustion in coal-fired steam-electric power plants are discussed. A fluidized-bed boiler system involving pneu-

matic introduction of coal having a size of one cm into a coarse bed of calcined limestone is described, techniques for adjusting the available heat transfer surface area, including adjustment of bed height and localization of the fluidizing air in the bed, are considered. A linearized dynamic model of an experimental fluidized-bed process plant, based on ten differential equations and several supporting algebraic relations, is derived. A data acquisition system which permits monitoring of the plant operation under a variety of control and output variables is also considered. J M B

**A77-48793 Fluidized-bed combustion of anthracite refuse** J S Mei, R L Gall, and J S Wilson (ERDA, Morgantown Energy Research Center, Morgantown, W. Va.) In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D.C., August 28-September 2, 1977, Proceedings Volume 1 La Grange Park, Ill., American Nuclear Society, Inc., 1977, p. 772-778. 9 refs

A total of five types of anthracite refuse material with widely different characteristics were successfully burned in the 0.46 m (18-inch) diameter atmospheric pressure fluidized-bed combustor at the Morgantown Energy Research Center of the U.S. Energy Research and Development Administration. Combustion characteristics of these anthracite refuse materials as well as engineering data were investigated for a wide range of operating conditions. Values of carbon combustion efficiency, sulfur dioxide and nitrogen oxides, heat transfer and heat release rates are presented. Results of this systematic study of the fluidized-bed combustion of anthracite refuse material indicate that a substantial amount of heating value contained in this rejected material can be recovered. This application of anthracite refuse represents a potential source of energy for a region of the country which would benefit from such a new source to replace increased oil use which has accompanied the decrease in anthracite coal mining (Author)

**A77-48795 Geothermal well stimulation with a secondary fluid** I Sheinbaum (I Sheinbaum Co., Pasadena, Calif.) In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D.C., August 28-September 2, 1977, Proceedings Volume 1 La Grange Park, Ill., American Nuclear Society, Inc., 1977, p. 798-803. 12 refs

The stimulation of liquid-dominated geothermal wells for maximizing the production of thermal energy is discussed. By injecting a secondary fluid down the geothermal well bore it is possible to optimize the production of a geothermal well and at the same time pump the geothermal heat to the surface. The system can be advantageously utilized for self-flowing and non-self-flowing geothermal reservoirs where the geothermal heat can be employed above ground in the production of power by any of the known power cycles. The use of this stimulation technique eliminates the necessity for down-hole pumping and the associated parasitic losses (Author)

**A77-48796 On evaluating the energy capacity and lifetime of fracture dominated geothermal reservoirs** G Sandquist, S Swanson (Utah, University, Salt Lake City, Utah), R Stoker, and J Kunze (Idaho National Engineering Laboratory, Idaho Falls, Idaho) In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D.C., August 28-September 2, 1977, Proceedings Volume 1 La Grange Park, Ill., American Nuclear Society, Inc., 1977, p. 804-809. 9 refs

An analytical model is proposed for describing the long duration fluid temperature inversions which have been measured in geothermal well shafts at the Raft River geothermal site after cold water reinjection and subsequent free outflow. These anomalous temperature distributions are apparently associated with fracture distributions of varying permeability and anisotropic thermal and mass transport properties. Laboratory model and field data are presented to support the reservoir model. It may be possible through a controlled series of cold water reinjection and free flow experiments to identify and evaluate the producing zones within fracture dominated, hot water geothermal systems (Author)

**A77-48797** **Geothermal space heating - The symbiosis with fossil fuel.** J F Kunze (Idaho National Engineering Laboratory, Idaho Falls, Idaho) In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D C, August 28-September 2, 1977, Proceedings Volume 1 La Grange Park, Ill, American Nuclear Society, Inc., 1977, p 810-815.

The economic viability of geothermal space heating supplemented by fossil fuel heating systems is discussed, with emphasis on applications of the concept in the 48 conterminous states of the U.S. In particular, expansion of an existing geothermal space heating system in Boise, Idaho is considered. Problems associated with such heating networks, including high capital costs and relatively low utilization factors, are reviewed. It is suggested that a geothermal heating network which would serve a large number of buildings and furnish heat to compensate for outside temperature levels of 20 or 30 F might be complemented by fossil-fuel heating to create a cost-effective system. J M B.

**A77-48798** **Energy extraction characteristics of hot dry rock geothermal systems.** J W Tester and M C Smith (California, University, Los Alamos, N Mex) In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D C, August 28-September 2, 1977, Proceedings Volume 1 La Grange Park, Ill, American Nuclear Society, Inc., 1977, p 816-823 14 refs ERDA-sponsored research

The Los Alamos Scientific Laboratory Hot Dry Rock Geothermal Energy Project is described. The project investigates the extraction of energy at useful temperatures and rates from naturally heated crustal rock which does not contain large amounts of innate steam or hot water. Methods applicable to formations of low or high initial permeability are considered, in particular, a technique for creating a closed pressurized-water heat extraction loop through production of a hydraulic fracture between two bore holes is mentioned. Fluid-flow and heat exchange calculations indicate that buoyant (unpumped) circulation through a large hydraulic fracture may provide heat extraction at commercially useful efficiencies. Determination of the economic feasibility of hydrothermal systems, based on criteria such as fluid-flow capacity, pressure losses, well and pumping costs, and lifetime of the facilities, is also discussed. J M B.

**A77-48799** **Liquid fluidized bed heat exchanger - Horizontal configuration experiments and data correlations.** C A Allen, O. Fukuda, E S Grimmer, and R E McAtee (Allied Chemical Corp., Idaho Falls, Idaho) In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D C, August 28-September 2, 1977, Proceedings Volume 1 La Grange Park, Ill, American Nuclear Society, Inc., 1977, p. 824-831 14 refs.

The heat transfer behavior of horizontal fluidized-bed heat exchangers was investigated, with the emphasis on applications to geothermal systems. Experimental data and published literature were used in devising a model of heat transfer from the fluidizing medium to a wall of the tube in a horizontal liquid-fluidized shell-and-tube heat exchanger. Empirical results were found to correlate well with the heat transfer equations developed by Hamilton (1970). The test data were also employed in modifying the distributor plate of the heat exchanger to achieve uniform flow through the bed material, and in determining preliminary corrosion, erosion and deposition properties of materials under consideration for geothermal applications. J M B.

**A77-48800** **A comparison of three working fluids for the design of geothermal power plants.** D G Shepherd (Cornell University, Ithaca, N Y) In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D C, August 28-September 2, 1977, Proceedings Volume 1 La Grange Park, Ill, American Nuclear Society, Inc., 1977, p. 832-841. 14 refs.

Three working fluids for use in binary-cycle geothermal power plants are investigated. The fluids selected for study are the halocarbon refrigerant R-21, isobutane and trifluoroethanol. Condenser, turbine and evaporator sizes needed to attain a range of cycle temperatures, pressures and outputs are determined. It was found that fouling resistance has a major effect on the heat transfer process,

so that the cycle efficiency of the geothermal power plants is a more important factor than fluid characteristics. Because of its superior thermodynamic performance, trifluoroethanol yields the lowest condenser and evaporator sizes, though at high outputs it requires double-flow turbines. J M B.

**A77-48801** **Cost and performance comparison of flash binary and steam turbine cycles for the Imperial Valley, California.** J. H. Eskesen (General Electric Co., Medium Steam Turbine Dept., Lynn, Mass) In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D C, August 28-September 2, 1977, Proceedings Volume 1 La Grange Park, Ill, American Nuclear Society, Inc., 1977, p. 842-849 Grant No. EY-76-C-02-2619.

A comparison is made of the performance and cost of dual flash organic Rankine (binary) cycles and steam turbine cycles designed specifically to exploit the geothermal resources at Niland and East Mesa in California's Imperial Valley. At East Mesa a steam turbine and binary cycle are compared. At Niland only the binary cycle is analyzed since the high CO<sub>2</sub> content of the resource precludes the use of condensing steam turbines. Turbine designs were formulated and costs established for power plants having a nominal generating capacity of 50MW. Steam and organic turbine generator costs are estimated to be approximately \$200/kW and \$100/kW, respectively, although savings in organic turbine costs are shown to be more than offset by heat exchanger costs and the high cost of organic condensers. Total installed cost for the steam turbine cycle at East Mesa is estimated to be almost \$600/kW compared to \$700/kW for the dual flash binary cycles at Niland and East Mesa, respectively.

**A77-48802** **The use of mixture working fluids in geothermal binary power cycles.** K E Starling, L W Fish, K. Z. Iqbal, and H. H. West (Oklahoma, University, Norman, Okla) In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D C, August 28-September 2, 1977, Proceedings Volume 1. La Grange Park, Ill, American Nuclear Society, Inc., 1977, p. 850-856 5 refs. Research supported by the University of Oklahoma and University Engineers, Inc., Contract No. E(40-1)-4944.

The use of hydrocarbon mixtures as working fluids in the geothermal binary power cycles provides certain advantages over systems based on pure component working fluids. The composition of the working fluid can be changed in response to long-term variations in the available geothermal resource temperature. The dew point of a mixture can be customized to permit a lower turbine exhaust temperature, thereby reducing the condenser load. Furthermore, the problem of retrograde condensation can be reduced, allowing the designer to maximize turbine efficiency or reduce the condenser desuperheating duty. The advantages of the use of hydrocarbon mixtures in geothermal binary power cycles are discussed in detail with attention to the effective use of the geothermal resource, thermodynamic efficiency, and cost effectiveness. Calculations using a process simulation program are presented to support the argument that mixtures can be tailored to match the characteristics of the geothermal resource and the limitations imposed by the power conversion cycle. (Author)

**A77-48803** **Geothermal power cycle analysis.** A R Schapiro and G. P. Hajela (Rockwell International Corp., Atomics International Div., Canoga Park, Calif.) In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D C, August 28-September 2, 1977, Proceedings Volume 1 La Grange Park, Ill, American Nuclear Society, Inc., 1977, p. 857-864. 5 refs.

A study was conducted to analyze and select (from the direct steam flash, flash binary, and direct binary cycles) a power generation cycle producing 10 MW net electric power output, that has the lowest capital cost for two brine models: one for high-temperature/high-salinity brine and the other for low-temperature/low salinity brine. For each cycle, the thermodynamic performance and capital cost were analyzed. The materials

of construction used in estimating the cost of the components were (1) carbon steel and (2) materials selected for each component that shows promise for longer life. Estimates with components constructed of carbon steel were made to give an equal basis to the comparison. The effects of the materials of construction upon the cycle selected were ascertained (Author)

**A77-48804** Multiparameter optimization studies on geothermal energy cycles W L Pope, H S Pines, L F Silvester, M A Green, and J D Williams (California, University, Berkeley, Calif.) In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D C, August 28-September 2, 1977, Proceedings Volume 1 La Grange Park, Ill., American Nuclear Society, Inc., 1977, p 865-869 12 refs ERDA-supported research

Various standard geothermal power cycles are modeled and optimized with program GEOTHM. The results are displayed in 3-D isometric form. These graphical plots vividly display the sensitivity of energy cost and other performance criteria as a result of departures from the design operating point. For example, the mutual interaction of energy cost, resource utilization efficiency, and resource temperature as an EC-RUE-RT surface for a range of temperatures between 100 C and 300 C can be studied. Calculation results may be presented for subcritical and supercritical binary cycles with several pure fluids, and on two stage flashed steam cycles for practical noncondensable gas levels (Author)

**A77-48805** Effect of reservoir temperature decline on geothermal power plant design and economics J W Hankin, R A Hogue, T A V Cassel, and T R Fick (Bechtel Corp., San Francisco, Calif.) In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D C, August 28-September 2, 1977, Proceedings Volume 1. La Grange Park, Ill., American Nuclear Society, Inc., 1977, p 870-876 Contract No E(04-3)-1124

**A77-48806** Design and field test of a steam powered downhole geothermal pump K E Nichols, D Prigmore (Barber-Nichols Engineering Co., Arvada, Colo.), H Matthews, and J Halat (Sperry Rand Research Center, Sudbury, Mass.) In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D C, August 28-September 2, 1977, Proceedings Volume 1 La Grange Park, Ill., American Nuclear Society, Inc., 1977, p 877-883 Research supported by the Sperry Rand Corp., ERDA, and NSF

A concept for pumping geothermal wells has been designed and tested in a well. The pump work required is extracted from the thermal energy of the brine by a downhole boiler. The resulting steam drives a turbopump delivering pressurized brine to the surface. The exhaust steam is ducted to the surface where it is condensed and returned to the downhole boiler. The TPU (turbine pump unit) utilizes a single stage mixed flow impeller that achieves pumping efficiencies over 80%, driven by a two-stage steam turbine. The shaft is supported by water-lubricated bearings that have been tested at temperatures over 400 F. The pumping tests were successful and it was demonstrated that the steam powered concept is feasible (Author)

**A77-48807** A two-phase rotary separator demonstration system for geothermal energy conversion D J Cerini (Biphasic Engines, Inc., Santa Monica, Calif.) In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D C, August 28-September 2, 1977, Proceedings Volume 1 La Grange Park, Ill., American Nuclear Society, Inc., 1977, p 884-892 6 refs

Direct utilization of two-phase geothermal well flow has been investigated experimentally with a rotary separator system. The system tested is a portion of a total-flow concept for geothermal energy conversion that incorporates the features of high efficiency, scale resistance and system simplicity. The first experimental system (two-phase nozzle, rotary separator, and liquid pickup) has demonstrated the ability to convert efficiently geothermal wellhead enthalpy to two-phase flow kinetic energy at the nozzle exit. The

performance measurements show a 36% conversion efficiency. The rotary separator removes the steam from the liquid flow, the liquid pickup converts liquid kinetic energy to either pressure or torque. Component efficiencies for nozzle, separator and liquid recovery were measured as a function of facility steam pressure and quality. Similar tests are in progress at a Brawley, California, geothermal well site to demonstrate performance and scale tolerance (Author)

**A77-48808** Performance of a total-flow impulse turbine for geothermal applications W J Comfort, III (California, University, Livermore, Calif.) In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D C, August 28-September 2, 1977, Proceedings Volume 1 La Grange Park, Ill., American Nuclear Society, Inc., 1977, p 893-898 7 refs Contract No W-7405-eng-48

A new, axial-flow impulse turbine was tested at LLL as part of the geothermal energy development program. Engine efficiency of this single-stage, two-phase expander was measured at 23% during a single-nozzle test. Performance predictions of a numerical model agreed with these results. Full-admission performance (based on the numerical-model and attainable nozzle thrust coefficients) indicates that engine efficiency can reach between 38 and 40% with present technology. Improved techniques for analyzing two-phase flow and further reduction of droplet sizes should provide 70% engine efficiency. (Author)

**A77-48809 \*** The helical screw expander evaluation project R A McKay (California Institute of Technology, Jet Propulsion Laboratory, Pasadena, Calif.) In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D C, August 28-September 2, 1977, Proceedings Volume 1 La Grange Park, Ill., American Nuclear Society, Inc., 1977, p. 899-903 Contracts No E(49-27)-1000, No NAS7-100

A positive-displacement helical-screw expander of the Lysholm type has been adapted for geothermal service and successfully demonstrated in a 50 kW prototype power system. Evaluation of the expander by tests of a new model in a 1 MW power system under wellhead conditions in selected liquid-dominated geothermal fields is proposed. The objectives are to determine the performance characteristics of the expander and power system over a broad range of operating conditions and also to examine the concept of wellhead power plants. Throttling and fractionation of the fluids from the test wells is planned to simulate a wide range of wellhead pressures and steam fractions. Variation in the expander exhaust pressure is also planned. The investigation will include expander efficiency, corrosion, erosion, scale formation and control, and endurance testing. Interaction studies with the wells and an electric grid are also proposed (Author)

**A77-48810** New turbodrill for geothermal drilling W C Maurer, J D Nixon, L W. Matson (Maurer Engineering, Inc., Houston, Tex.), and J C. Rowley (California, University, Los Alamos, N. Mex.) In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D C, August 28-September 2, 1977, Proceedings Volume 1. La Grange Park, Ill., American Nuclear Society, Inc., 1977, p. 904-911. 21 refs ERDA-sponsored research

Development of a high-temperature (275 C) turbodrill for use in drilling thermal wells is described. The turbodrill was developed to meet the directional drilling requirements encountered in completing geothermal wells in hot dry rock, where conventional downhole drilling motors are found to degrade rapidly, due to detrimental effects of the elevated temperatures. The device, which was designed to allow part of the drilling fluid to circulate through the axial thrust roller bearings for lubrication and cooling, has turbine blading that provides four times the torque of existing drill motors. Spare seals were incorporated in the drill mechanism to minimize the number of round trips needed for repairs and replacement. J M.B.

**A77-48811** Thermocorer for geothermal applications. G M. Benson (ERG, Inc., Oakland, Calif.) In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D.C., August

28-September 2, 1977, Proceedings Volume 1.

La Grange Park, Ill., American Nuclear Society, Inc., 1977, p. 912-917, 12 refs NSF Grant No. GI-43100.

Thermocorer, a thermo-mechanical core-drill, uses recirculating hot melts and rotating jet-nozzles to produce advance rates 1000 times faster than achieved by the Subterrene and at specific energy consumptions approximating those of conventional rotary drills. Advance is produced by forming a kerf with resulting core and glass-lined bore-hole. The kerf is formed by dynamic thermo-natural-gas-fired Brayton cycle engine that drives a Rankine cycle heat pump. A centrifugal freon compressor is driven directly from the Brayton engine rotating group through a permanent magnet coupling. Unique features that offer high life cycle performance include a hermetically sealed magnetic coupling, air foil bearings, an atmospheric in-line combustor, and a high temperature recuperator. Predicted overall engine efficiency is 27 percent and predicted overall coefficient of performance at the energy source is 0.85 in cooling and 1.0 in heating. (Author)

**A77-48812** Development of a sulfur-iodine thermochemical water-splitting cycle for hydrogen production. J. R. Schuster, J. L. Russell, Jr., K. H. McCorkle, K. J. Mysejs, J. H. Norman, D. R. O'Keefe, R. Sharp, S. A. Stowell, P. W. Trester, and D. G. Williamson (General Atomic Co., San Diego, Calif.) In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D. C., August 28-September 2, 1977, Proceedings Volume 1, La Grange Park, Ill., American Nuclear Society, Inc., 1977, p. 920-927, 5 refs. Research supported by the General Atomic Co. and University of California.

A three-step thermochemical water-splitting cycle is being developed for the producing hydrogen from nonfossil energy sources. This cycle, which employs sulfur and iodine, can be conducted as an all liquid-and-gas process using concentrated solar heat or heat from a high-temperature gas cooled reactor (HTGR). All chemical reactions have been shown to proceed rapidly and cleanly. In coupling the cycle to an HTGR, process engineering has produced an estimate of 41.4% for net thermal efficiency. Recent favorable chemical data indicate that a considerable increase in efficiency will be obtained for the next flow sheet. Material corrosion testing has shown some commercial construction materials to be candidates for containing portions of the chemical process. (Author)

**A77-48813** Development progress on the Sulfur Cycle Water Decomposition System. G. H. Farberman, R. L. Ammon, C. C. Hardman, and S. Spewock (Westinghouse Electric Corp., Advanced Energy Systems Div., Pittsburgh, Pa.) In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D. C., August 28-September 2, 1977, Proceedings Volume 1, La Grange Park, Ill., American Nuclear Society, Inc., 1977, p. 928-932, 5 refs.

The Sulfur Cycle Water Decomposition System is a two-step hybrid electrochemical/thermochemical process, which produces hydrogen electrolytically and oxygen thermochemically. Areas investigated include the electrolyzer, where progress is being made toward demonstrating overall cell voltages of 450 mV at 200 mA/cm<sup>2</sup> - the performance level believed representative of a commercially-sized unit. The evaluation of catalysts for the reduction of sulfur trioxide (from sulfuric acid) to sulfur dioxide and oxygen and the evaluation of structural and heat transfer materials suitable for use in the high-pressure, high-temperature environment of the sulfuric acid vaporization and subsequent reduction are also studied. In addition, the evaluation of process flow sheet modifications to assess the potential process efficiency is considered. (Author)

**A77-48814** Irreversibilities, heat penalties, and economics for the methanol/sulfuric acid process. J. E. Funk (Kentucky, University, Lexington, Ky.) and K. F. Knoche (Rheinisch-Westfälische Technische Hochschule, Aachen, West Germany). In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D. C., August 28-September 2, 1977, Proceedings Volume 1, La Grange Park, Ill., American Nuclear Society, Inc., 1977, p. 933-938, 8 refs.

A thermodynamic availability analysis which relies on a step-by-step treatment of entropy production and heat penalty terms to determine process irreversibilities is described. Heat penalties are used as an indicator of the amount of thermal energy evolved by the primary energy source, and as a measure of the overall process efficiency. The analysis is applied to a four-step thermochemical cycle involving methanol production and sulfuric acid decomposition, the effects of each stage of the process on the overall thermal efficiency, capital cost and production cost are given. J.M.B.

**A77-48815** Recent developments in the engineering and chemistry of the ZnSe thermochemical hydrogen cycle. H. H. Otsuki, R. K. Pearson, and O. H. Krikorian (California, University, Livermore, Calif.) In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D. C., August 28-September 2, 1977, Proceedings Volume 1, La Grange Park, Ill., American Nuclear Society, Inc., 1977, p. 939-946, 10 refs. Contract No. W-7405-eng-48.

An improved version of the ZnSe thermochemical cycle for hydrogen production is described. Findings on the ZnCl<sub>2</sub> high temperature steam hydrolysis of liquid ZnCl<sub>2</sub> and on the kinetics of decomposition of H<sub>2</sub>Se are also presented. A preliminary design of a process based on the improved cycle was prepared to examine the overall thermal efficiency and to derive hydrogen production costs. Conceptual designs for several critical equipment items are given and their special features discussed. Overall thermal efficiency of the cycle depends strongly on the ability to recover reaction heats and match them with process heat requirements. Thermal efficiency of the cycle is estimated to be about 42%, the estimated cost for hydrogen production is about \$13.50 per million BTUs. (Author)

**A77-48816** Irreversibilities in thermochemical cycles for hydrogen production by water decomposition. K. E. Cox and M. Natarajan (New Mexico, University, Albuquerque, N. Mex.) In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D. C., August 28-September 2, 1977, Proceedings Volume 1, La Grange Park, Ill., American Nuclear Society, Inc., 1977, p. 947-950, 12 refs.

**A77-48817** A new family of hydrogen storage alloys based on the system nickel-mischmetal-calcium. G. D. Sandrock (International Nickel Co., Inc., Paul D. Merica Research Laboratory, Suffern, N. Y.) In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D. C., August 28-September 2, 1977, Proceedings Volume 1, La Grange Park, Ill., American Nuclear Society, Inc., 1977, p. 951-958, 19 refs. Research supported by the International Nickel Co.

A family of low-cost intermetallic hydrogen storage compounds based on the formula Ca(x)M(1-x)Ni<sub>5</sub> has been developed. M is the standard rare earth alloy mischmetal and x can be varied from 0 to 1. The basic properties are presented as a function of x, including pressure-temperature-composition relations, ease of activation, heats of reaction, relative materials cost, melting and other metallurgical considerations, and crystal structure correlations. The system offers several desirable properties including raw materials costs per unit of hydrogen storage capacity less than one-third that of present LaNi<sub>5</sub>, room temperature plateau pressures ranging from 30 to 0.5 atm, very low hysteresis, and easy activation. (Author)

**A77-48818** A hydrogen-halogen energy storage system for electric utility applications. A. Beaufrere, R. S. Yeo, S. Srinivasan (Brookhaven National Laboratory, Upton, N. Y.), J. McElroy (General Electric Co., Wilmington, Mass.), and G. Hart (Energy Development Associates, Madison Heights, Mich.) In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D. C., August 28-September 2, 1977, Proceedings Volume 1, La Grange Park, Ill., American Nuclear Society, Inc., 1977, p. 959-963. ERDA-sponsored research.

A techno-economic assessment is made for a hydrogen-chlorine energy storage system for electric utility load leveling and peak shaving applications. The proposed system consists of a GE Solid Polymer Electrolyte Cell, metal hydride hydrogen storage, and liquid

chlorine/hydrochloric acid storage subsystems. The electrochemical cell operates under high pressure, which facilitates both hydrogen uptake by the metal hydride and production of chlorine as a liquid in the cell. The waste heat from the cell is used for decomposition of the hydride to release the storage hydrogen. Experiments carried out show that it should be possible to attain overall efficiencies above 70% at high power densities (at least a factor of 5 higher than that for advanced batteries). Since the reactants for chemical and electricity generation are stored outside the cell, this system appears quite suitable for electric energy storage applications in both peaking and load leveling cycles. (Author)

**A77-48819 \*** The liquid hydrogen option for the subsonic transport - A status report. P. F. Korycinski (NASA, Langley Research Center, Hampton, Va.) In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D.C., August 28-September 2, 1977, Proceedings Volume 1. La Grange Park, Ill., American Nuclear Society, Inc., 1977, p. 964-972. 22 refs.

Studies dealing with the use of liquid hydrogen for fuel in subsonic air transport systems are reviewed. Topics of the studies include the possibility for economical production of hydrogen, the problems associated with the efficient liquefaction of the gas, the development of insulation materials and materials for long-lasting liquid hydrogen fuel tanks, the difficulties related to fueling processes and the installation of liquid hydrogen fuel stations at major air terminals, an assessment of the hazards connected with liquid hydrogen fuels, and the engineering and design problems involved in incorporating liquid hydrogen fuel systems into large subsonic passenger aircraft. **A77-48820** Supercorrodng alloys for generating heat and hydrogen gas. S. S. Sergev and S. A. Black (U.S. Navy, Civil Engineering Laboratory, Port Hueneme, Calif.) In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D.C., August 28-September 2, 1977, Proceedings Volume 1. La Grange Park, Ill., American Nuclear Society, Inc., 1977, p. 973-980.

Supercorrodng magnesium alloys have been developed that react rapidly and predictably with seawater to produce heat and hydrogen gas. The alloys are formed by a mechanical process that bonds magnesium and noble metal powder particles together. The reaction rate has been shown to increase with increasing temperature and increasing noble metal content. A maximum reaction rate exists at an optimum proportion of parent materials. Reaction rates for several noble materials have been determined. The effect of pressure on the reaction has been investigated but not determined. The alloy powders can be sintered to form barstock suitable for self-contained corrodng links. Supercorrodng alloys are superior to previous similar methods for producing heat and gas. (Author)

**A77-48821** Hydrogen separation and production from coal-derived gases using Fe/x/TiNi/1-x/. V. Cholera and D. Gidaspow (Institute of Gas Technology, Chicago, Ill.) In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D.C., August 28-September 2, 1977, Proceedings Volume 1. La Grange Park, Ill., American Nuclear Society, Inc., 1977, p. 981-986. 8 refs. Research supported by the Institute of Gas Technology.

Sorbents for use in the low-temperature separation of hydrogen from coal-derived gases containing methane and nitrogen were investigated. Data from experiments involving packed-bed batch reactors indicate that low decomposition pressure alloys of the Fe(x)TiNi(1-x) type were able to extract hydrogen from the methane mixtures in a highly efficient process. However, it was found that carbon dioxide and similar impurities interfere with the hydrogen generation, removal of the impurities or use of more expensive alloys based on lanthanum-nickel series is proposed to circumvent the problem. J. M. B.

**A77-48822** Design of the Montana Magnetohydrodynamics Component Development and Integration Facility. W. D.

Jackson, M. S. Mintz (ERDA, Washington, D.C.), F. Shaffron (Ralph M. Parsons Co., Pasadena, Calif.), R. P. Del Bueno (Gilbert Associates, Reading, Pa.), V. Pearson (Argonne National Laboratory, Argonne, Ill.), and J. D. Plunkett (Montana Energy MHD Research and Development Institute, Inc., Butte, Mont.) In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D.C., August 28-September 2, 1977, Proceedings Volume 2.

La Grange Park, Ill., American Nuclear Society, Inc., 1977, p. 988-994. ERDA-supported research.

The Montana MHD Component Development and Integration Facility, developed by ERDA with the aim of achieving a commercial open-cycle MHD electric power generation system, is described. The 50-thermal megawatt facility was designed to assess the interaction of various MHD components and subsystems. In particular, hot gas flow train elements, including combustors, nozzles, channels, magnets and inverters, are to be studied at the plant. Processes such as coal and seed preparation, combustion air preheating, water circulation and treatment, combustion slag quench and removal, exit gas quench and scrubbing, and wastewater collection are also to be analyzed. J. M. B.

**A77-48823** A description of the direct coal-fired MHD facility at the University of Tennessee Space Institute. J. B. Dicks, K. E. Tempelmeyer, H. P. Markant, Y. C. L. Wu, J. F. Martin, J. W. Muehlhauser, and L. W. Crawford (Tennessee University, Tullahoma, Tenn.) In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D.C., August 28-September 2, 1977, Proceedings Volume 2. La Grange Park, Ill., American Nuclear Society, Inc., 1977, p. 995-1003. 14 refs. Contract No. EX-76-C-01-1760.

A direct coal-fired MHD facility capable of running continuously at the coal flow rate of 3 tons/hour and intermittently up to one hour continuous operation at a coal flow rate of about 10 tons/hour is described. The facility contains all essential components of a central power MHD station except the air preheater. Current results in seed recovery and SO<sub>2</sub> reduction are reported. The overall objective of this facility is to advance the technology of direct coal-fired MHD components and systems required for MHD power systems operating under simulated central power station conditions. Specific objectives are to resolve technical problems which occur in direct coal-fired MHD systems which moderate-to-high ash carryover with Eastern coals. (Author)

**A77-48824** Progress in channel development for direct coal fired MHD. A. Solbes and S. W. Petty (Avco Everett Research Laboratory, Inc., Everett, Mass.) In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D.C., August 28-September 2, 1977, Proceedings Volume 2. La Grange Park, Ill., American Nuclear Society, Inc., 1977, p. 1004-1014. ERDA-sponsored research.

This paper reviews the progress in the development work of magnetohydrodynamic (MHD) channels for direct coal fired MHD power generation, carried out at AERL. The results of extensive testing in a slagging environment using a 6 lb/sec experimental facility, are presented and discussed. Channel performance characteristics are presented both for diagonal and Faraday mode loading. The local channel behavior and the development of nonuniformities are analyzed together with fault simulation experiments. The results of a 100 hour duration run are presented. Cathode, anode and insulator problems are discussed together with the results of several subsequent tests aimed at evaluating various candidate materials for both anode and cathode walls. (Author)

**A77-48825** Compressed air energy storage for electric utility load leveling. K. G. Vosburgh, D. C. Golibersuch, P. M. Jarvis, J. A. Bast, J. H. Eskesen (General Electric Co., Schenectady, N.Y.), A. S. Mitchell (Fenix and Scission, Inc., Tulsa, Okla.), E. J. Sosnowicz (United Engineers and Constructors, Inc., Boston, Mass.), J. Pepper (Electric Power Research Institute, Palo Alto, Calif.), and S. Serata. In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D.C., August 28-September 2, 1977,

Proceedings, Volume 2 La Grange Park, Ill., American Nuclear Society, Inc., 1977, p. 1016-1022 10 refs  
Research supported by the Electric Power Research Institute

The results of a conceptual design of a compressed air energy storage plant employing a solution mined salt cavern located on the McIntosh dome in southwestern Alabama are presented. A weekly storage cycle is used and power is generated at 800 MW for 2000 hours per year. Various design options are discussed, including a plant optimized for peaking duty. An evaluation of the operating economics of the designs, a new method for computing the efficiency of compressed air storage plants, and a discussion of experiments which might be performed at a demonstration plant are also presented (Author)

**A77-48826** Compressed air storage for load leveling of nuclear power plants. Z. S. Stys (Brown Boveri Corp., North Brunswick, N.J.) In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D.C., August 28-September 2, 1977, Proceedings Volume 2 La Grange Park, Ill., American Nuclear Society, Inc., 1977, p. 1023-1030. 9 refs

Air Storage Energy Transfer (ASSET) plants are installations which optimize the operation of predominantly nuclear base-loaded systems by providing for energy transfer to equalize the fluctuations in energy demand. Until a short time ago pumped hydro was the only commercially available system capable of accomplishing the energy transfer. With the advent of the ASSET concept, transfer of the energy can be accomplished using compressed air instead of water as a medium. This paper describes the general concept of ASSET plants as well as the first installation of this type now being built at Huntorf, West Germany (Author)

**A77-48827** Electron beam heated solenoid reactors for fusion power and fissile fuel breedings. J. Benford (Physics International Co., San Leandro, Calif.) In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D.C., August 28-September 2, 1977, Proceedings Volume 2 La Grange Park, Ill., American Nuclear Society, Inc., 1977, p. 1059-1065. 9 refs

The use of electron beams to heat linear solenoids and the application of such heating processes to fusion reactors or to fissile fuel breeding are discussed. The mechanisms involved in electron-beam heating of plasma, as well as the processes by which axial heat losses from the plasma occur, are reviewed. Advantages of the electron beam heat process, such as a generation efficiency of 80%, are also considered. In addition, systems involving linear solenoids may offer high beta properties together with linear geometries, making maintenance of plasma stability a simpler problem than for toroidal geometry schemes J M B

**A77-48828** Development status - Binary Rankine cycle waste heat recovery system. H. L. Rhinehart (ERDA, Div. of Conservation, Washington, D.C.), C. P. Ketler (Department of Public Utilities and Public Works, Rockville Centre, N.Y.), and R. K. Rose (Mechanical Technology, Inc., Latham, N.Y.). In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D.C., August 28-September 2, 1977, Proceedings Volume 2 La Grange Park, Ill., American Nuclear Society, Inc., 1977, p. 1090-1094.

This paper presents the status of a program under development by MTI for USERDA and concerns development and demonstration of a binary-Rankine cycle waste-heat recovery system for a Diesel generating set. The demonstration site is located at an existing municipal power plant in the Village of Rockville Centre, New York. The system employs two safe and well accepted power fluids, steam and Freon, and recovers 500 kw from the exhaust of a turbocharged Diesel engine. The two fluid cycle generally exhibits higher thermal efficiency, depending upon gas temperature, than a cycle employing a single power fluid. The steam topping cycle buffers the Freon bottoming cycle so that the system can be applied over a wide range of gas temperatures and not be limited by the stability limits of organic power fluids. The machinery arrangement features two radial

inflow turbines driving a common output gear. Conventional process and refrigeration industry heat exchange components have been adapted for use in the system (Author)

**A77-48829** 600 kW Organic Rankine Cycle Waste Heat Power Conversion System. R. M. Cheek and P. D. Lacey (Sundstrand Corp., Rockford, Ill.). In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D.C., August 28-September 2, 1977, Proceedings Volume 2 La Grange Park, Ill., American Nuclear Society, Inc., 1977, p. 1095-1099

The 600 kW Organic Rankine Cycle Waste Heat Power Conversion System, which can be adapted to heat sources such as diesel engine exhaust, gas turbine exhaust, or industrial process waste heat streams, is described. Design criteria for the waste heat recovery system, including selection of power rating, waste heat temperature range and working fluid, are reviewed, development programs involving 425 or 315 C source temperatures and toluene as the working fluid are discussed. Components of the system, such as the boost pump, feed pump, regenerator, vaporizer, turbine and condenser are also considered. The prototype system developed has the advantages of being adaptable to use with a large reciprocating engine as the heat source, and of accommodating several inches of pressure drop without upsetting the operation of the heat source J M B

**A77-48830** Combined diesel-organic Rankine-cycle power plant. H. E. Soini, P. S. Patel, D. T. Morgan (Thermo Electron Corp., Waltham, Mass.), and S. K. Batra (New England Power Service Co., Westborough, Mass.). In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D.C., August 28-September 2, 1977, Proceedings Volume 2 La Grange Park, Ill., American Nuclear Society, Inc., 1977, p. 1100-1107

Components and performance predictions are given for a combined diesel-organic Rankine-cycle electric power generating system. The organic Rankine system will provide 440 kW of additional power by recovering energy from the exhaust gases of a 2500-kW-diesel engine powerplant. For this system, the increase in power output is 18 percent with no increase in fuel consumption, even though the prime mover is a two-cycle diesel engine with relatively low exhaust gas temperature and the engine back pressure is limited to 1.244 kilopascal (5.0 inches of water). For other prime movers without these limitations, even greater improvement is possible. (Author)

**A77-48831** Energy conversion and storage by CDE /concentration difference energy/ engine and system. N. Isshiki, Y. Maekawa, M. Takeuchi (Tokyo Institute of Technology, Tokyo, Japan), I. Nikai (Ishikawajima-Harima Heavy Industries Co., Ltd., Tokyo, Japan), T. Akuta (Nippon Steel Corp., Tokyo, Japan), and J. Kamoshida (Shibaura Institute of Technology, Omiya, Japan). In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D.C., August 28-September 2, 1977, Proceedings Volume 2 La Grange Park, Ill., American Nuclear Society, Inc., 1977, p. 1117-1124. 8 refs

This paper is concerned with a theoretical and experimental investigation of a completely new engine called the CDE (concentration difference energy) engine. The CDE engine utilizes the absorption heat liberated from the exhaust steam absorbed in a thick aqueous solution of inorganic salts as  $\text{CaCl}_2$ ,  $\text{LiCl}$ ,  $\text{NaOH}$  etc. in which the original pure steam boiler is immersed. In the CDE system many kinds of alternative energies are used for the regenerations of used solutions thinned by the CDE engine above, and can be converted into useful power and heat (Author)

**A77-48832** Solar powered steam generation. D. Magnoli, M. Saddy, A. V. de Carvalho, Jr., M. R. Lima Verde Leal (Centro de Tecnologia Promon, Rio de Janeiro, Brazil), J. B. de Siqueira, and T. Oniga (Instituto Nacional de Tecnologia, Rio de Janeiro, Brazil). In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D.C., August 28-September 2, 1977, Proceedings Volume 2 La Grange Park, Ill., American Nuclear Society, Inc., 1977, p. 1127-1133. 7 refs

Generation of low-pressure saturated steam was investigated conceptually using conventional types of solar collectors. Performance analyses were carried out for single flat-plate collectors with one and two covers, selective absorbing surfaces and honeycomb structure, and for parabolic concentrators with focal axis along East-West or Polar directions. Selection of the best collectors was carried out for 20 deg south latitude, and was followed by computation of the steam outputs for the latitudes of 10, 20, and 30 deg south, for clear days at the equinox, winter and summer solstices. Setting the steam production at around 10 ton/day, 1000 three-square-meter collectors were required. Economic evaluation showed that although the system does not currently compete with conventional steam generation, it might be feasible in the medium term and for remote locations (Author)

**A77-48833 High temperature solar collector with an Archimedes concentrator** Z I Antoniuk and H B Palmer (Pennsylvania State University, University Park, Pa.) In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D C, August 28-September 2, 1977, Proceedings, Volume 2, La Grange Park, Ill, American Nuclear Society, Inc., 1977, p 1134-1140 14 refs

A 1.5 m-long experimental model of a high-temperature solar concentrator-collector in which argon is employed as a working fluid was studied. Experiments were performed with fluid flow rates covering a range of Reynolds numbers from 200 to 2000, resulting in a fluid temperature rise of up to 285 C in the (axial) flow direction. Maximum temperatures attained by the fluid under no-flow conditions were in the 350-390 C range. A computer model of this system which takes into account most of the influential variables was formulated, temperature profiles that agree with the experimental data at all axial positions within about 10 C were obtained (Author)

**A77-48834 Development status of the fixed mirror solar concentrator** J L Russell, Jr, J R Schuster, and G H Eggers (General Atomic Co, San Diego, Calif) In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D C, August 28-September 2, 1977, Proceedings, Volume 2, La Grange Park, Ill, American Nuclear Society, Inc., 1977, p 1141-1146 7 refs

The General Atomic Company fixed mirror solar concentrator (FMSC) employs a fixed mirror trough that produces a sharp line focus regardless of sun position. The heat receiver is moved in a circular arc to track the focal line. FMSC modules of precast concrete and glass mirrors are being fabricated to supply a 260 sq m mirror field to Sandia Laboratories for their Solar Total Energy Demonstration Facility (Author)

**A77-48835 Considerations for using solar concentrators in photovoltaic systems** C E Backus, D L Evans, L W Florschuetz, D L Jacobson, and B D Wood (Arizona State University, Tempe, Ariz) In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D C, August 28-September 2, 1977, Proceedings, Volume 2, La Grange Park, Ill, American Nuclear Society, Inc., 1977, p 1147-1153 14 refs. Research supported by Sandia Laboratories, NSF Grant No. GI-41894, Contract No. E(11-1)-2590

Concentration of sunlight onto solar cells can reduce the cost of electricity from photovoltaic systems in the near term and possibly even after flat photovoltaic array costs have been reduced by more than an order of magnitude. Cells have been designed especially for high concentrations and have efficiencies as high as present day space cells. The cooling of cells under high concentrations does not seem to be a major constraint. The ultimate cost of these systems depends mostly on the cost per unit aperture of the reflective or refractive surface. Higher efficiency concentration cells are often desirable even if their costs are higher (Author)

**A77-48836 Solar cell array for concentrated sunlight.** G. Yekutieli, A Brandstetter, B. Haber, R Joulzary, E Kritchman, and J Mandelkorn (Weizmann Institute of Science, Rehovot, Israel) In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D C, August 28-September 2, 1977, Proceedings, Volume 2, La Grange Park, Ill, American Nuclear Society, Inc., 1977, p 1154-1158 10 refs. Research supported by the Ministry of Commerce and Industry of Israel

The work effort at the Weizmann Institute on high concentration solar cell arrays is described. The results of the study phase of the program, which involved procurement and evaluation of system components, were favorable, and integration of selected components and systems is underway. The criteria developed and the data from solar cells, optics, and tracking tests are discussed. Details of a successful laboratory model 2 axis tracking system are presented. It is concluded that development of high concentration arrays having efficiencies of at least 10% is now possible (Author)

**A77-48837 Photovoltaic applications for the National Park Service** P O Jarvinen, C R Peatfield (MIT, Lexington, Mass.), and H Haiges (National Park Service, Denver, Colo.) In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D C, August 28-September 2, 1977, Proceedings, Volume 2, La Grange Park, Ill, American Nuclear Society, Inc., 1977, p 1159-1166 ERDA-sponsored research

ERDA has engaged MIT/Lincoln Laboratory in its field tests and applications project for solar photovoltaic systems. This paper describes one of the applications of the project namely, the placement, test and monitoring of solar photovoltaic systems that serve installations of the U S National Park Service (NPS). Attention is given to site selection procedures and an NPS photovoltaic site investigation summary is presented. Of 10 promising sites considered, Natural Bridges National Monument, Utah was selected for the first application. Cottonwood Ranger Station at Joshua Tree National Monument, California represents a good alternative site. B.J

**A77-48839 An assessment of mechanical energy storage for solar systems.** H M Dodd, Jr, R E D Stewart, S G Varnado, E A Aronson (Sandia Laboratories, Albuquerque, N Mex), and G C Chang (ERDA, Washington, D C) In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D C, August 28-September 2, 1977, Proceedings, Volume 2, La Grange Park, Ill, American Nuclear Society, Inc., 1977, p 1174-1180 9 refs

The primary objective of this study is to assess the relative merits of various mechanical energy storage systems when used in conjunction with solar and wind sources. This initial study considered flywheel, pneumatic (compressed air) and underground pumped hydro storage concepts. Both thermal and photovoltaic collectors utilizing stationary flat plate through total tracking focused systems were included. For wind collection, a horizontal axis wind turbine was modeled. Electrical load demands from single residences through utility grids were included. Alternative systems were ranked according to levelized, busbar energy cost calculations, and the amount of displaced, conventionally generated electricity also served as a benefit measure (Author)

**A77-48840 Evaluation of a chemical heat storage system for a solar steam power plant.** J Dayan, A S. Foss, and S Lynn (California, University, Berkeley, Calif) In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D C, August 28-September 2, 1977, Proceedings, Volume 2, La Grange Park, Ill, American Nuclear Society, Inc., 1977, p 1181-1188 15 refs. ERDA-supported research

A heat storage system employing the reversible chemical reaction  $\text{SO}_3 \rightleftharpoons \text{SO}_2 + 1/2 \text{O}_2$  is synthesized and integrated with the central receiver and conventional steam power cycle of a solar electric power plant. Heat absorption by the chemical reaction takes

place in the receiver during the day, heat release in a separate reactor produces 36 MWe all night through steam generation at 2400 psi and 1000 F. For optimum use of heat, the storage system needs to be integrated during the daytime with a steam raising system having a power input about 5 times the storage charge rate. The overall efficiency of the combined system (net electrical output/thermal input) is about 35% (Author)

**A77-48841 Thermal energy storage.** B L Pierce, F R Spurrier, and M K Wright (Westinghouse Electric Corp., Advanced Energy Systems Div., Pittsburgh, Pa.) In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D.C., August 28-September 2, 1977, Proceedings Volume 2. La Grange Park, Ill., American Nuclear Society, Inc., 1977, p 1189-1194

A discussion of a thermal energy storage subsystem is provided which is integrated into a steam Rankine solar thermal electric power generation system. It uses phase change and sensible heat characteristics of the steam for energy transport and encapsulated salt for energy storage. Direct contact heat exchange is featured in the storage subsystem which has superior thermodynamic performance and equipment simplicity compared to present baseline designs using indirect heat transfer features such as being considered for the Central Receiver Solar Power 10 MW(e) Pilot Plant System integration and operation, thermal performance and mechanical design are discussed (Author)

**A77-48842 Integration of high temperature thermal energy storage into a solar thermal Brayton cycle power plant.** W D Beverly, W W Engle, and F O Mahony (Boeing Engineering and Construction, Seattle, Wash.) In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D.C., August 28-September 2, 1977, Proceedings Volume 2. La Grange Park, Ill., American Nuclear Society, Inc., 1977, p 1195-1202. 5 refs. Research sponsored by the Electric Power Research Institute, Contract No. EY-76-C-03-1300

Analytical methods have been developed to support the design and analysis of thermal energy storage (TES) systems for solar thermal power plants employing high temperature Brayton, closed cycle thermal engines with helium or air as the heat transport fluid. System level studies have been undertaken to assess the impact of storage on plant performance, to establish storage system design and performance requirements, and to evaluate various TES design alternatives. Conceptual designs with cost estimates are presented for sensible heat and phase change TES devices. Solar power plant design sensitivity data showing the trades between collector area, storage time, plant performance, plant costs, and busbar energy costs are also included (Author)

**A77-48843 Design of sodium-cooled, central receiver solar power plant.** T L Johnson and W B Thomson (Rockwell International Corp., Atomic International Div., Canoga Park, Calif.) In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D.C., August 28-September 2, 1977, Proceedings Volume 2. La Grange Park, Ill., American Nuclear Society, Inc., 1977, p 1203-1208. Grant No. EG-76-G-05-5178

The design of a 100-MWe sodium-cooled, central receiver solar power plant is presented. A sodium-cooled system has the advantages of good heat transfer, stable coolant flow, and high efficiency. Sodium components either are available now or will soon be available as a result of the sodium-cooled reactor programs. A description of three liquid sodium heat transport systems is presented. Several alternative storage options are examined. The all sodium thermal storage concept using a hot storage tank and a cold storage tank is simple, affords operational flexibility, and effectively decouples the receiver system operation from the steam generator - a substantial operational advantage. A sodium quantity of 15.3 x 10 to the 6th kg is required for 6 h of plant operation on stored energy at 100% of rated power. The sodium-cooled plant initial cost is slightly less than an equivalent water-cooled plant. However, leveled energy costs are 18% lower for the mid-1980's (Author)

**A77-48844 Solar thermal conversion to electricity utilizing a central receiver, open cycle gas turbine design.** J C Grosskreutz, E J McBride, and D C Gray (Black and Veatch, Consulting Engineers, Kansas City, Mo.) In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D.C., August 28-September 2, 1977, Proceedings Volume 2. La Grange Park, Ill., American Nuclear Society, Inc., 1977, p 1209-1217. Research supported by the Electric Power Research Institute

A conceptual design of a 60 MWe gas turbine solar/electric system has been completed. Four cavity type, ceramic-tube heat exchangers produce the 1800 F air required. The turbine-generator and receiver cavities are located at the top of a 650 foot reinforced tower, which is surrounded by two-axis tracking heliostats. The capital cost of the plant, in 1976 dollars, is estimated as \$1350-\$1660 per kilowatt, depending on heliostat costs. Hybrid operation makes this plant eligible for capacity credit in a utility network. The primary hardware development required is the ceramic tube heat exchanger. Silicon carbide tubes have been thermally cycled, using radiant heat, for over 600 cycles with material temperatures up to 2430 F. No tube failures or material degradation were experienced (Author)

**A77-48845 \* Dynamic modeling and sensitivity analysis of solar thermal energy conversion systems.** C L Hamilton (California Institute of Technology, Jet Propulsion Laboratory, Pasadena, Calif.) In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D.C., August 28-September 2, 1977, Proceedings Volume 2. La Grange Park, Ill., American Nuclear Society, Inc., 1977, p 1218-1223. 5 refs. Contract No. NAS7-100

Since the energy input to solar thermal conversion systems is both time variant and probabilistic, it is unlikely that simple steady-state methods for estimating lifetime performance will provide satisfactory results. The work described here uses dynamic modeling to begin identifying what must be known about input radiation and system dynamic characteristics to estimate performance reliably. Daily operation of two conceptual solar energy systems was simulated under varying operating strategies with time-dependent radiation intensity ranging from smooth input of several magnitudes to input of constant total energy whose intensity oscillated with periods from 1/4 hour to 6 hours. Integrated daily system output and efficiency were functions of both level and dynamic characteristics of insolation. Sensitivity of output to changes in total input was greater than one (Author)

**A77-48846 1 MWth solar cavity steam generator solar test program.** T R Tracey, F A Blake (Martin Marietta Aerospace, Denver, Colo.), C Royere (CNRS, Odeillo, Pyrenees-Orientales, France), and C T Brown (Georgia Institute of Technology, Atlanta, Ga.) In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D.C., August 28-September 2, 1977, Proceedings Volume 2. La Grange Park, Ill., American Nuclear Society, Inc., 1977, p 1224-1230. Grant No. EY-76-C-03-1068, Contract No. E(40-1)-4921

The primary objective of this program was to demonstrate the efficient conversion of solar energy to thermal energy in the form of steam as soon as possible. The largest solar test facility available was the 1 MWth facility located in Odeillo, France. Therefore, the test article was designed for testing at the 1 MW level. The test article is a cavity type receiver with an aperture of 1.03 meters. The inner walls consist of blackened steel tubes designed to deliver steam at 8619 kPa and 510 C. The solar testing consisted of a total of 161 hours of which 71.5 hours were at rated operating conditions 8619 kPa, 510 C and 105 hours were at full boiler pressure. The maximum power input was 738 KW. The measured thermal efficiency of the cavity was 92 percent. During the program the receiver was cycled to rated conditions twenty-six times and the boiler was cycled to rated conditions thirty times. In addition, many other transients were encountered including cloud interruptions (Author)

**A77-48847** Deterministic insolation estimates for solar total energy systems. E P French (Rockwell International Corp, Space Div, Downey, Calif) In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D C, August 28-September 2, 1977, Proceedings Volume 2 La Grange Park, Ill, American Nuclear Society, Inc, 1977, p 1231-1237, 8 refs Contract No E(04-3)-1210

A simple method of evaluating the solar energy available to a collector is described. Radiation at cloudless times is estimated from the calculated solar position and the seasonally varying properties of a standard atmosphere. Local atmospheric effects are incorporated into two empirical coefficients, a clearness number and a cloud factor, which can be derived from long-term average insolation. The method successfully predicts variations in incident energy as a function of collector orientation and tracking strategy. Net collector energy gains are also well estimated if cloud factors are based on observed average percent possible sunshine (Author)

**A77-48848** Miniature solar-electric power system J E Drummond (Maxwell Laboratories, Inc, San Diego, Calif) In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D C, August 28-September 2, 1977, Proceedings Volume 2 La Grange Park, Ill, American Nuclear Society, Inc, 1977, p 1238-1242, 12 refs

The paper describes a small solar power system designed for a single family dwelling. The total system consists of five subsystems: optical, thermal input, thermal-to-electrical conversion, waste heat deployment and control. A typical system would consist of 22 stages of ferroelectric heat engines each using nearly-Carnot cycles and 23 intervening, electrically actuated, heat pipes. Each stage is 30 micrometers thick and each heat pipe 1.7 cm long. A kW converter would fit inside a box 20 cm square by 45 cm high, the converter would weigh 3 kg and would pay back the energy required for mining, refining and combining the materials of which it is constructed in 22 days at a quarter of its peak power output. A computer simulation of the growth of the solar industry involving commercial and federal buildings was performed to investigate the costs and benefits to both the solar industry and the federal government of a solar demonstration program. Using this information, a comparison of a Commercial Demonstration Program (CDP) and a Federal Buildings Program (FBP) designed to stimulate the solar industry is presented. Also given is the response of the solar industry and the consumer market as predicted by the model (Author)

McEver (InterTechnology/Solar Corp, Warrenton, Va) In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D C, August 28-September 2, 1977, Proceedings Volume 2 La Grange Park, Ill, American Nuclear Society, Inc, 1977, p 1255-1262

**A77-48854 \*** Tests and evaluation of multihundred watt thermoelectric generators at JPL P Rouklove (California Institute of

Technology, Jet Propulsion Laboratory, Pasadena, Calif) In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D C, August 28-September 2, 1977, Proceedings Volume 2 La Grange Park, Ill, American Nuclear Society, Inc, 1977, p 1287-1293 Contract No NAS7-100

The multihundred watt (MHW) thermoelectric generator, based on silicon-germanium thermoelectric technology, delivers a nominal power output of 150 watts with an efficiency of about 6%. The two Voyager space probes each use three such generators assembled in tandem on a boom. A total of seven MHW type thermoelectric generators were tested at JPL in support of the Voyager project. The tests consisted of (1) parametric evaluation of the electrical characteristics of the devices over a wide range of output voltage for different values of input power, different operating ambients (air, vacuum), and different internal environments (argon, helium, xenon, mixture of these gases, and vacuum) at different pressures to allow evaluation of the influences of both gas and pressure on the performance of the generator, (2) tests to determine the transient behavior of the generators, and (3) operation of the generator in conjunction with the Voyager spacecraft (Author)

**A77-48855** An assessment of the materials needs for a Kr-85 fuel capsule. N B Elsner, J C Bass, T S Roemer, and P W Trester (General Atomic Co, San Diego, Calif) In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D C, August 28-September 2, 1977, Proceedings Volume 2 La Grange Park, Ill, American Nuclear Society, Inc, 1977, p 1294-1301, 20 refs Army-supported research

Kr-85 is considered as an alternate isotopic heat source in place of others, such as Pu-238 and Sr-90. RTGs using Kr-85 could possibly be used in applications where the nuclear safety requirements are less stringent. Fuel capsules would have to contain the gas at operating pressures up to 69.0 MPa, be compatible at 623 K with the liquid metal Rb, the daughter product of Kr-85, and provide adequate gamma shielding. An overall candidate material for the capsule would be the alloy Ta-10W since it is likely to be compatible with Rb, would offer a high shielding to volume ratio, and would be capable of demonstrating suitable and uniform mechanical properties, a requirement for high-pressure gas containment systems. Five alloys were selected as candidates for fuel capsules. The scope of an initial phase qualification program is presented which deals with verifying both corrosion resistance and absence of degradation of deformation ability and toughness in the candidate alloys after exposure to Rb. Results are presented of a comparison of the weights of similar RTG systems using PuO<sub>2</sub>, SrTiO<sub>3</sub>, or Kr-85 as the heat source materials (Author)

**A77-48856** Terrestrial RTG designs featuring disc-shaped thermoelectric modules P E Eggers (Ridighigh, Eggers and Associates, Columbus, Ohio) In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D C, August 28-September 2, 1977, Proceedings Volume 2 La Grange Park, Ill, American Nuclear Society, Inc, 1977, p 1302-1309

A terrestrial radioisotope thermoelectric generator design is described which features the use of two annular or disk-shaped converters at either end of the heat source. The disk-shaped converters were thermally coupled to the heat source via a threaded interface. Pressure loading was accomplished through the use of tapered threads on the heat source and a resilient, thermally conductive member at the cold side (outer diameter) of the annular converter. In this manner, the heat source is supported by the thermoelectric converters at either end of the heat source. An additional feature of this design is the use of a thermal switch which serves to shunt heat from the heat source to the RTG casing when the casing temperature exceeds a predetermined set point (range) (Author)

**A77-48857** Design of a spherical RTG K. A Kroos and J. E. A. John (Toledo, University, Toledo, Ohio) In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D C, August 28-September 2, 1977, Proceedings Volume 2 La Grange Park, Ill, American Nuclear Society, Inc, 1977, p 1310-1316, 8 refs

The radioisotope thermoelectric generator is ideally suited for a spacecraft power supply. To date, all RTG's are of a cylindrical design with small individual thermoelectric generators placed along the side of the cylinder. A spherical design with individual generators covering the entire surface has the advantages of less heat loss and improved thermal paths. Problems of construction can be overcome by the use of individual 'plug-in' type thermoelectric generators. The design utilizes silicon-germanium as the semiconductor material for high power output. A heat transfer analysis yielded hot and cold shoe temperatures of 1040 C and 255 C, respectively, with an average surface temperature of 130 C. A power output of 76.6 watts at 14 volts for a 10-year life time was predicted. Specific power was found to be comparable to the SNAP 19 generator but a space reduction of 85% is achieved by not using fins (Author)

**A77-48858** Reactor hybrid-Organic Rankine Cycle Electric Power Systems /ORCEPS/ for space applications. J. E. Boretz (TRW Defense and Space Systems, Redondo Beach, Calif.). In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D.C., August 28-September 2, 1977, Proceedings Volume 2. La Grange Park, Ill., American Nuclear Society, Inc., 1977, p. 1317-1322. 6 refs.

There are many new space applications for the 1985 to 1995 time period that will require electric power systems in the 10 to 100 KWe range. An operating life of from 5 to 7 years is desired. To achieve these comparatively high power levels and long life goals at low system weights, both high performance and conservative system design approaches are required. This paper discusses various candidate systems and describes a system which combines the inherent reliability of a static thermoelectric conversion unit with a low development risk dynamic power conversion unit. By employing the heat rejected from the thermoelectric conversion unit as the heat input to the dynamic power conversion unit, high overall cycle efficiencies are obtainable. This results in a light weight, small size system which when employing a U-235-ZrH reactor, with a 12 deg cone angle shadow shield, as a heat source can achieve a system specific weight of 50 to 75 lbs/KWe (Author)

**A77-48860 \*** SEP full-scale wing technology development. R. V. Elms, Jr. (Lockheed Missiles and Space Co., Inc., Sunnyvale, Calif.) and L. E. Young (NASA, Marshall Space Flight Center, Huntsville, Ala.). In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D.C., August 28-September 2, 1977, Proceedings Volume 2. La Grange Park, Ill., American Nuclear Society, Inc., 1977, p. 1329-1334. Contract No. NAS8-31352.

A technology development program has generated a detail design of a lightweight 25 kW solar array for Solar Electric Propulsion (SEP). The fabrication and test of a full-scale array wing, 32.0 m x 4.06 m, is in progress to demonstrate technology readiness for fabrication, testing and flight of the large area lightweight solar array system. This paper presents the requirements for the 66 W/kg array and the component testing that has been performed to demonstrate technology readiness in the areas of SEP mission environmental survival, zero-gravity flat-fold array retraction, and NDT development testing. A zero-gravity test program was performed in the NASA KC-135 aircraft using a three-panel, full-width segment of the flat-fold array blanket with three degrees of panel stiffening. The full-scale solar array wing being fabricated is composed of three electrical modules, 76 x 200 cm, and mass simulator panels each 76 x 400 cm employing 2 x 4 cm glass slides (4.5 panels) and aluminum mass simulators (35 panels) (Author)

**A77-48865 \*** Technology for power in space. J. P. Mullin and L. B. Holcomb (NASA, Washington, D.C.). In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D.C., August 28-September 2, 1977, Proceedings Volume 2. La Grange Park, Ill., American Nuclear Society, Inc., 1977, p. 1362-1369. 33 refs.

The two distinct future directions of the NASA Space Power Research and Technology Program are toward multikilowatt power levels at low cost and toward very high performance. The develop-

ment of both of these directions is reviewed and attention is given to the underlying conversion technologies: photovoltaic, chemical energy conversion and storage, and thermal-to-electric conversion. Problems of environmental compatibility are briefly discussed. (B.J.)

**A77-48866** Photovoltaic solar power satellites. V. A. Caluori and H. Oman (Boeing Aerospace Co., Seattle, Wash.). In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D.C., August 28-September 2, 1977, Proceedings Volume 2. La Grange Park, Ill., American Nuclear Society, Inc., 1977, p. 1378-1385. 6 refs.

A synchronous-orbit photovoltaic solar power satellite would have a 146 sq km array, a pair of one-km diameter antennas, and deliver 10 GW from its earth station for 30 years. For solar cells the choice is silicon, with an efficiency of not much over 18 percent at standard space conditions, or gallium arsenide with perhaps 21% by 1987, and much better resistance to radiation and less loss as the cell gets hot. Solar-flare protons are the main cause of radiation damage, degrading silicon cells protected by 50 microns of glass to 54% of initial output after 30 years. Thicker covers, weighing 200,000 kg per micron per 100 sq km are not optimum. Power lost by radiation degradation might be compensated by array refurbishment or thermal annealing the cells. Concentrating sunlight is not as useful as previously expected, the reflectors being quickly degraded to 62% reflectance by radiation. Plasma leakage current losses restrict array voltages to around 1500 V at 500 km altitude if electric thrusters operate. In geosynchronous orbit leakage current at 40 kV would be trivial (Author)

**A77-48868** Solar power satellites - A system overview. G. Woodcock (Boeing Aerospace Co., Seattle, Wash.). In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D.C., August 28-September 2, 1977, Proceedings Volume 2. La Grange Park, Ill., American Nuclear Society, Inc., 1977, p. 1391-1398. 7 refs.

Studies sponsored by NASA and ERDA are currently defining the systems, development approaches, and risks and costs for the Solar Power Satellite (SPS) venture and evaluating the probable benefits of the system against these risks and costs. This paper presents a list of requirements that an SPS system must satisfy and provides a definition of the system concept. SPS payback and energy economics, satellite systems design considerations, energy conversion configurations, and SPS development and commercialization are all touched upon. (B.J.)

**A77-48869** Power satellite construction location considerations. E. E. Davis (Boeing Aerospace Co., Seattle, Wash.). In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D.C., August 28-September 2, 1977, Proceedings Volume 2. La Grange Park, Ill., American Nuclear Society, Inc., 1977, p. 1399-1404.

One of the major decisions concerning an operational solar power satellite program is that of whether the satellite should be constructed in LEO (low earth orbit) or GEO (geosynchronous earth orbit). Key considerations such as satellite design differences, construction provisions, operations and environmental factors, transportation alternatives and cost are compared for the two construction location options. Both options have been found to offer desirable advantages. Design and operational factors favor GEO construction, however, transportation cost advantages make the LEO option considerably more attractive. Since a power satellite program would be in competition with other energy sources, the final decision in this matter will be highly sensitive to cost. Should the current trend continue, however, the LEO construction option with an electric orbit transfer vehicle offers the greatest payoff (Author)

**A77-48870 \*** Solar power satellite concepts and potential related space systems. T. E. Redding (NASA, Johnson Space Center, Systems Evaluation Office, Houston, Tex.). In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D.C., August 28-September 2, 1977, Proceedings Volume 2.

La Grange Park, Ill., American Nuclear Society, Inc., 1977, p 1405-1411

Recent parametric studies of alternate SPS design concepts have shown that the concept appears technically feasible. The parametric studies were based on the use of advanced technology silicon solar cells for solar energy conversion. Solar array blanket unit masses of 0.31 to 0.46 kg/sq m were investigated. Conversion efficiencies of 15 to 17 percent air mass zero (AMO at 247 K) with a concentration ratio of two were considered. The systems were sized for a ground power output of 10 GW. To the level of detail studied, no design or operational problems were encountered that did not appear amenable to solution, however, the economic viability of the SPS concepts studied is obviously dependent upon a combination of technology advancement and/or the costs of competitive sources.

**A77-48871** Design and analysis of a 5000-MW GaAlAs satellite power system. A. D. Tonelli and W. V. McRae (Rockwell International Corp., Space Div., Downey, Calif.). In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D.C., August 28-September 2, 1977, Proceedings Volume 2.

La Grange Park, Ill., American Nuclear Society, Inc., 1977, p 1412-1420. 10 refs.

A satellite power system (SPS) was investigated for delivering 5,000 MW to the utility user on the ground for the post-1990 time period. The SPS is located in a geosynchronous orbit, and utilizes GaAlAs solar cells to generate electrical power which is distributed to the satellite microwave antenna. The antenna converts the dc power into RF power which is transmitted to the ground and is received and collected by a rectenna. The rectenna converts the RF energy back to electrical energy and delivers the dc power to the utility grid. The reference SPS configuration is 2.05 km wide by 26.7 km long. The SPS employs reflective mirrors to enhance the solar energy impinging on the GaAlAs cells which results in a significant weight and cost savings. A concentration ratio of 2 was used for the reflectors in the study. The overall efficiency of the SPS was calculated to be 7.5%, and the weight is 24.15 x 10 to the 6th kg.

**A77-48872 \*** Space power system design and development from an economic point of view. G. A. Hazelrigg, Jr. (ECON, Inc., Princeton, N.J.). In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D.C., August 28-September 2, 1977, Proceedings Volume 2.

La Grange Park, Ill., American Nuclear Society, Inc., 1977, p. 1421-1427. 8 refs. Contract No. NAS8-31308.

The concept of a satellite solar power system offers a feasible, but unproven, long-range energy alternative. While the basic physics of these systems is understood, many developments are necessary in order to reduce the system cost to the point of being cost-competitive with alternative energy sources. Thus, a substantial technology advancement and verification program, plus test and demonstration satellite programs are necessary before a full-scale satellite can be designed and built. It is important to properly identify those elements of the technology that should be subject to development efforts, the goals of the corresponding development programs and the appropriate funding levels and schedules. Systems studies and designs play a major role in rationally formulating a development program. This paper uses an economic approach to place these studies into a framework for formulating a viable satellite solar power system development plan.

**A77-48874** The evolution of the photovoltaic, gravitationally stabilized, solid-state satellite solar power station. L. J. Cantafio, V. Chobotov, and M. G. Wolfe (Aerospace Corp., El Segundo, Calif.). In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D.C., August 28-September 2, 1977, Proceedings Volume 2.

La Grange Park, Ill., American Nuclear Society, Inc., 1977, p 1437-1444. 22 refs.

An SSPS concept, the gravitationally stabilized, solid-state satellite solar power station has been identified which alleviates a number of the major technical problems associated with other previously proposed SSPS designs. This paper discusses the evolution of the solid state concept. It describes a specific example which consists of 24 pairs of sun-pointing 385 x 2000-m solar panels, 3 km between centers, attached to a 72-km long, 2-m diameter, low-loss circular waveguide supplying microwave energy to a 797-m solid-state dipole transmitting antenna. The array is passively stabilized by the gradient of the gravitational forces and therefore requires virtually no propellant replenishment servicing. The total satellite weighs approximately 19.5 x 10 to the 6th kg and supplies 5 GW of rectified power at the ground.

**A77-48875 \*** Space-borne power conversion into a microwave beam and its impact on the environment of the upper atmosphere. O. E. Maynard, A. H. Katz (Raytheon Co., Wayland, Mass.), and W. E. Whitacre (NASA, Marshall Space Flight Center, Huntsville, Ala.). In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D.C., August 28-September 2, 1977, Proceedings Volume 2.

La Grange Park, Ill., American Nuclear Society, Inc., 1977, p 1445-1452. 11 refs. Contract No. NAS8-31308.

The possible effect of microwave beams transmitted from Solar Power Satellites on the ionosphere has been studied theoretically. Particular attention is given to microwave-beam-heating of the F and D layers and theoretical predictions of such ionospheric modifications are used to determine resulting effects on the transmission efficiency of communication and navigation systems. It is recommended that a three-pronged technology and demonstration program be established to study microwave effects. The program would include theoretical studies, ground-based heating experiments, and an orbital experimental program for phase control of the microwave power transmission system.

**A77-48876 \*** Thermoelectronic laser energy conversion for power transmission in space. E. J. Britt and C. Yuen (Rasor Associates, Inc., Sunnyvale, Calif.). In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D.C., August 28-September 2, 1977, Proceedings Volume 2.

La Grange Park, Ill., American Nuclear Society, Inc., 1977, p 1453-1460. 7 refs. NASA-sponsored research.

Long distance transmission of power in space by means of laser beams is an attractive concept because of the very narrow beam divergence. Such a system requires efficient means to both generate the laser beam and to convert the light energy in the beam into useful electric output at the receiver. A plasma-type device known as a Thermo-Electronic Laser Energy Converter (TELEC) has been studied as a method of converting a 10.6 micron CO2 laser beam into electric power. In the TELEC process, electromagnetic radiation is absorbed directly in the plasma electrons producing a high electron temperature. The energetic electrons diffuse out of the plasma striking two electrodes with different areas. Since more electrons are collected by the larger electrode there is a net transport of current, and an EMF is generated in the external circuit. The smaller electrode functions as an electron emitter to provide continuity of the current. Waste heat is rejected from the large electrode. A design for a TELEC system with an input 1 MW laser beam was developed as part of the study. The calculated performance of the system showed an overall efficiency of about 42%.

**A77-48877** **Optimizing a low cost satellite energy system**  
J E. Drummond (Maxwell Laboratories, Inc., San Diego, Calif.) In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D C., August 28-September 2, 1977, Proceedings Volume 2  
La Grange Park, Ill., American Nuclear Society, Inc., 1977, p 1461-1467 11 refs

The paper describes the Iso-insolation Power Satellite (IPS) system which would, among other things, eliminate localized enhancement of electron density in the ionosphere arising from and deflecting microwave transmission from power satellites, introduce a new satellite form which appears to be an improvement on current designs, significantly reduce power converter mass through utilization of a ferroelectric heat engine, and greatly reduce the size and weight of both the transmitting and receiving antennas due to the much shorter microwave link. It appears that a relatively simple derivative of the Space Shuttle could be used to implement the IPS system, and that - once implemented - such a system could provide power continuously worldwide at a cost significantly lower than fossil or nuclear power. A condition on the system's economy is that it must have load centers distributed throughout the world including the oceans where hydrogen could be produced for mobile vehicle use (Author)

**A77-48878 \*** **Comparative assessment of orbital and terrestrial central power plants.** R Caputo (California Institute of Technology, Jet Propulsion Laboratory, Pasadena, Calif.) In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D C., August 28-September 2, 1977, Proceedings Volume 2  
La Grange Park, Ill., American Nuclear Society, Inc., 1977, p 1468-1475 Contract No NAS7-100

Recent studies of the space power system (SPS) are integrated into a total social cost framework developed for terrestrial central electric power systems. Total social costs include the projection of commercial economics to the time frame of interest as well as the federal research, development and demonstration (RD&D) costs, the health impacts, the resources required, the environmental impacts and other social costs. The SPS system is limited to transporting all materials from the earth's surface to geosynchronous orbit. Only silicon photovoltaic is considered as the SPS energy conversion technique. Costs and impacts of the LWR are considered as a reference for nuclear systems, and the low BTU coal gasification with combined cycle gas and steam turbines is considered as a reference for a fossil central electric plant. The ground solar systems considered are solar thermal using the central receiver approach with thermal storage, and solar photovoltaic using the silicon cell with battery storage (Author)

**A77-48879** **Thermal oscillators.** G M Benson (ERG, Inc., Oakland, Calif.) In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D C., August 28-September 2, 1977, Proceedings Volume 2  
La Grange Park, Ill., American Nuclear Society, Inc., 1977, p. 1478-1487 31 refs

Thermoscillators are resonant-free-piston, valveless, closed-cycle thermal machines. The engine, operating on a Stirling or Ericsson cycle, drives a shaftless load (pump, generator, refrigerator, or combination). The engine and load form a compact, integral, hermetically-sealed, gas-lubricated unit, that self-starts and load-modulates by self-varying stroke, pressure-ratio and piston-phasing without changing working-fluid mass or speed. Results for two- and three-piston Thermoscillators are presented and compared with other free-piston Stirling engines. Data are given for improved heat exchangers, including Thermizers which isothermalize the variable-volume chambers. Results for a Thermoscillator alternator (60 Hz, 120V) give 50% plant efficiencies which, for units using fossil-fuel firing (including fluidized coal) or solar energy, offers a potential for local electric generation with direct waste heat recovery. Results for a Thermoscillator hydraulic pump, isothermal accumulator and hydraulic motor for vehicle drive promise fuel mileages of 100-200 m/gal for urban-cycle and 50-100 m/gal for freeway-cycle (Author)

**A77-48880** **Demonstration of a Free-Piston Stirling Linear Alternator power conversion system.** B Goldwater (Mechanical

Technology, Inc., Latham, N Y) and R B Morrow (ERDA, Nuclear Research and Applications Div., Washington, D C.) In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D C., August 28-September 2, 1977, Proceedings Volume 2  
La Grange Park, Ill., American Nuclear Society, Inc., 1977, p 1488-1495 6 refs

A program is in progress to develop and demonstrate Free Piston Stirling-Linear Alternator (FPS-LA) energy conversion systems for the Division of Nuclear Research and Applications of ERDA. The major objective of the program is to demonstrate a 2 Kwe conversion system at an overall efficiency of greater than 30%, defined as the measured conditioned power output divided by the measured electrical power to the simulated heat source. The heat sources potentially available for the FPS-LA conversion system are nuclear (both isotopic and reactor), solar, and fossil fuels with external combustion. This paper describes Phase I feasibility evaluations of the engine and the alternator as well as a conceptual system design. B J

**A77-48882** **Practicability study of Stirling total energy systems.** D Lehrfeld (North American Philips Laboratories, Briarcliff Manor, N Y) In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D C., August 28-September 2, 1977, Proceedings Volume 2.  
La Grange Park, Ill., American Nuclear Society, Inc., 1977, p 1504-1511 6 refs ERDA-supported research

Under U S ERDA contract, Philips Laboratories has investigated the application of Stirling cycle prime movers to total energy power generation systems. Electrical, heating, and cooling demand profiles for a typical residential complex, hospital, and office building were studied, and alternative Stirling total energy systems were conceptualized for each site. These were analyzed in detail and contrasted with purchased-power systems for these sites to determine fuel-energy savings and investment attractiveness. The residential complex and hospital would be excellent candidates for total energy systems, and prime movers in the 1000 kW output range would be required. Stirling engines with so large an output have not been built to date. The principle advantage of a Stirling prime mover in this application, in view of national concern over present and future dependence on oil, is that it could utilize low grade liquid fuels and coal (Author)

**A77-48884** **A new mathematical model for Stirling cycle machines.** D M Berchowitz, C J Rallis, and I Urieli (Witwatersrand, University, Johannesburg, Republic of South Africa) In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D C., August 28-September 2, 1977, Proceedings Volume 2  
La Grange Park, Ill., American Nuclear Society, Inc., 1977, p. 1522-1527 7 refs

A mathematical model for Stirling cycle machines is presented in which the effects of pressure difference is made up of two components, viz (1) the time lag for information to propagate along the machine which causes a phase displacement between the expansion and compression pressure profiles, and (2) the real flow effects which cause an amplitude displacement in the pressure profiles. It is shown that both these effects are functions of machine speed, and thus the machine speed becomes a parameter which affects the overall performance. The solutions are presented, one in which only the phase displacement is calculated, i.e., there is no friction and the cycle is otherwise ideal, and the other which includes both phase and amplitude displacements (Author)

**A77-48885** **A new ported constant volume external heat supply regenerative cycle.** C J Rallis, I Urieli, and D M Berchowitz (Witwatersrand, University, Johannesburg, Republic of South Africa) In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D C., August 28-September 2, 1977, Proceedings Volume 2  
La Grange Park, Ill., American Nuclear Society, Inc., 1977, p. 1534-1537 6 refs

The Stirling cycle is but one member of one of the classes of possible regenerative cycles. Also the in-line configurations of heater, regenerator and cooler currently in use are not necessarily optimal

This paper uses so-called first order or ideal thermodynamic cycle analysis to compare the performance of three ideal cycles - the true Stirling, the pseudo-Stirling used in most practical machines, and the so-called ported constant volume cycle. The effects on the dependent variables, of thermal efficiency and specific work, of regenerator effectiveness and volume compression ratio in particular, are considered and it is shown that the characteristics of the ported constant volume cycle are superior to those of the pseudo-Stirling cycle

**A77-48886 \*** NASA Thermionic Conversion program J. F. Morris (NASA, Lewis Research Center, Thermionics and Heat-Pipe Section, Cleveland, Ohio) In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D.C., August 28-September 2, 1977, Proceedings Volume 2 La Grange Park, Ill., American Nuclear Society, Inc., 1977, p 1540-1547 14 refs

NASA's program for applied research and technology (ART) in Thermionic Energy Conversion (TEC) has made worthwhile contributions in a relatively short time. Materials and designs previously prohibited by in-core nucleonics and geometrics now offer new potentialities. High-temperature material effects are crucial to the level and duration of TEC performance. New electrodes must increase and maintain power output regardless of emitter-vapor deposition on collectors. They must also serve compatibly with hot-shell alloys. And while space TEC must face high-temperature vaporization problems externally as well as internally, terrestrial TEC must tolerate hot corrosive atmospheres outside and near-vacuum inside. Furthermore, some modes for decreasing interelectrode losses appear to require rather demanding converter geometries to produce practical power densities

**A77-48887 \*** Thermionic converter studies at Thermo Electron. F. N. Huffman, D. Lieb, and F. Ruffe (Thermo Electron Corp., Waltham, Mass.) In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D.C., August 28-September 2, 1977, Proceedings Volume 2 La Grange Park, Ill., American Nuclear Society, Inc., 1977, p. 1548-1554 19 refs Grant No EX-76-C-02-3056, Contract No NAS3-20302

The Thermionic Energy Converter (TEC) development program includes theoretical and experimental surface studies, diode evaluation, enhanced mode converter investigations and system studies, as well as materials fabrication and testing. The primary effort has been concentrated on increasing converter performance via improved electrodes. Diodes with oxide collectors (i.e., tungsten oxide, titanium oxide, zinc oxide and barium oxide) have provided the best performance. Emitters requiring reduced cesium pressure (such as oxygenated tungsten, lanthanum hexaboride, platinum and graphite) are being tested. Converter configurations using particle spacing are under investigation. Experiments with auxiliary electrode thermionic converters are in progress. Both silicon carbide and alloy hot shells (i.e., barriers to isolate the converter from the combustion environment) have been fabricated and tested.

**A77-48888 \*** Thermionic converter performance with oxide collectors. D. Lieb, D. Goodale, T. Briere, and C. Balestra (Thermo Electron Corp., Waltham, Mass.). In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D.C., August 28-September 2, 1977, Proceedings Volume 2 La Grange Park, Ill., American Nuclear Society, Inc., 1977, p 1555-1562 6 refs Grant No EY-76-C-02-3056, Contract No NAS3-20302

Thermionic converters using a variety of metal oxide collector surfaces have been fabricated and tested. Both work function and power output data are presented and evaluated. Oxides of barium, strontium, zinc, tungsten and titanium have been incorporated into a variable spacing converter. Tungsten oxide was found to give the highest converter performance and to furnish oxygen for the emitter at the same time. Oxygenated emitters operate at reduced cesium pressure with an increase in electrode spacing. Electron spectroscopy for chemical analysis (ESCA) performed on several tungsten oxide collectors showed cesium penetration of the oxide layer, possibly

forming a cesium tungstate bronze. Titanium oxide showed high performance but did not furnish oxygen for the emitter, strontium oxide, in the form of a sprayed layer, appeared to dissociate in the presence of cesium. Sprayed coatings of barium and zinc oxides produced collector work functions of about 1.3 eV, but had excessive series resistance. Lanthanum hexaboride, in combination with oxygen introduced through a silver tube, and cesium produced a low work function collector and better than average performance

**A77-48889 \*** Status of research on advanced thermionic converters. G. L. Hatch, W. Rhiner, N. S. Rasor, and L. K. Hansen (Rasor Associates, Inc., Sunnyvale, Calif.) In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D.C., August 28-September 2, 1977, Proceedings Volume 2 La Grange Park, Ill., American Nuclear Society, Inc., 1977, p 1563-1567 7 refs ERDA-NASA-supported research

It is shown that it is possible to controllably and continuously elevate the electron temperature in the plasmatron thermionic energy converter from the emitter temperature to the maintenance electron temperature for the diode arc mode. This ability and the apparent validity of an elementary analytical model of the plasma should make possible the optimization and evaluation of operation under strong ionization conditions for which the plasma resistance should be acceptably low. Measurement of the vacuum space charge arising from the emission from a surface in cesium vapor indicates the presence of a substantial negative ion emission current. Apparatus has been constructed for identifying and directly measuring the flux of positive, negative and neutral species emitted from an electrode surface in a cesium vapor diode. The primary purpose of the investigation is to determine the influence of negative ion emission on the effective work function of thermionic converter electrodes. Initial data indicate the presence of H(-), Cs(-) and possibly C(-) and CH(-)

**A77-48890 \*** Low arc drop hybrid mode thermionic converter. K. Shimada (California Institute of Technology, Jet Propulsion Laboratory, Pasadena, Calif.) In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D.C., August 28-September 2, 1977, Proceedings Volume 2 La Grange Park, Ill., American Nuclear Society, Inc., 1977, p 1568-1574 ERDA-sponsored research, Contract No NAS7-100

The hybrid mode operation for the reduction of plasma drops is being investigated. This report discusses the results obtained from two molybdenum emitter converters. One converter had a molybdenum collector and the other a nickel collector. The molybdenum collector converter was operated in a hybrid mode (at an interelectrode distance of 1.7 mm) and produced a minimum barrier index of 1.96 eV at an emitter temperature of 1500 K. The arc drop was calculated to be 0.14 eV, using the published results for a molybdenum collector. On the other hand, the nickel collector converter was operated in a conventional ignited mode (at an interelectrode distance of 0.5 mm) and produced a minimum barrier index of 2.1 eV at an emitter temperature of 1700 K. It is tentatively concluded that a large-gap operation of the hybrid mode converter permits the diffusion of cesium ions to a distance in the order of one millimeter for an effective neutralization of electron space charge. By employing a low work function collector (1.55 eV) in a hybrid mode converter with an arc drop of 0.14 eV, it appears that a barrier index as low as 1.69 eV could be achieved

**A77-48893 \*** Solar thermionic power systems for terrestrial applications. K. Shimada and M. Swerdlow (California Institute of Technology, Jet Propulsion Laboratory, Pasadena, Calif.). In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D.C., August 28-September 2, 1977, Proceedings, Volume 2. La Grange Park, Ill., American Nuclear Society, Inc., 1977, p 1590-1601. 12 refs. Contract No NAS7-100.

The results of a feasibility study which showed that a low-temperature, high-efficient thermionic power system can efficiently convert solar energy to electrical energy without heat

transport, as required by most solar thermal systems are described. A 3-dimensional (2-axis tracking) 93 sq m parabolic solar concentrator, consisting of mirrors on a foam glass substrate and designed to a concentration ratio (mirror area/aperture area) of 2000 is considered for producing a design temperature of 1100 C at an efficiency of 74%. A tracking subsystem must track the sun at an accuracy of a nominal plus or minus 1.0 degree for maximum use of the sun's energy. Each complete solar thermionic power system unit rated at about 20 kWe peak can generate approximately 48,000 kWh/yr. In addition, a thermal energy conversion system can be cascaded within the thermionic power system so that the high quality waste heat can be further utilized to increase the net electrical output. Potential applications of a solar thermionic power generation system are remote sites, apartment house complexes, heating and cooling, hydrogen production and large power stations (Author)

**A77-48894** Increased central station power plant efficiency with a thermionic topping system. G O Fitzpatrick, E J Britt (Rasor Associates, Inc., Sunnyvale, Calif.), and G Carnasciali (Foster Wheeler Development Corp., Livingston, NJ). In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D C., August 28-September 2, 1977, Proceedings Volume 2. La Grange Park, Ill., American Nuclear Society, Inc., 1977, p 1602-1609. 6 refs. ERDA-supported research.

Preliminary system studies reported in the past have shown that combined thermionic-steam system efficiencies in excess of 50% may be achieved. The purpose of this study was to evaluate the THX (Thermionic Heat Exchanger) approach to topping on a basis which permits comparison with recent studies of other advanced power systems. An overall power plant efficiency of 46.8% was calculated as compared with an untopped system efficiency of about 36%. The estimated capital cost per installed kw was \$902/kw for a plant coming on line in 2000. Possible methods of increasing overall efficiencies to 52% and reducing capital costs to \$700/kw were identified. The modular nature of the THX units permits their development at relatively low cost. It may be possible to proceed through the pilot plant demonstration stage by retrofitting an older existing furnace in an operating power plant with a small number of representative THX units (Author)

**A77-48895** Evaluation of MHD-thermionic-steam cycles. G Miskolczy and F N. Huffman (Thermo Electron Corp., Waltham, Mass.). In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D C., August 28-September 2, 1977, Proceedings Volume 2. La Grange Park, Ill., American Nuclear Society, Inc., 1977, p 1610-1616. 15 refs. Grant No. EY-76-C-02-3056.

Studies of thermionic topped steam power plants have indicated that plant efficiencies up to 50 percent should be possible. Similar results are suggested for MHD topped steam powerplants. The operating temperature range of Thermionic Energy Converters (TEC) complements that of MHD and steam. Initial analyses indicate that plant efficiencies over 55 percent are obtainable from a system of MHD topping a thermionic cycle that is bottomed by a steam cycle. In one of the cycles studied, the steam for the bottoming cycle was generated using a TEC boiler. In this cycle, 37 percent of the net power is produced by MHD, 25 percent by the steam bottoming system. A heat exchanger concept for matching the high energy density of the MHD channel to the flux capabilities of the thermionic converters has been formulated (Author)

**A77-48896** Two general methods for the unsteady aerodynamic analysis of horizontal-axis windmills. R D. Preuss, E. O. Suciu, and L. Morino (Boston University, Boston, Mass.). In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D C., August 28-September 2, 1977, Proceedings Volume 2. La Grange Park, Ill., American Nuclear Society, Inc., 1977, p 1618-1623. 11 refs. Contract No. E(49-18)-2415.

The problem of a horizontal-axis windmill embedded in incompressible, inviscid flow is considered. The vorticity field present in the undisturbed flow is assumed to be unperturbed by the presence

of the windmill, enabling the use of a potential formulation. Two integral equation methods (for finite thickness and zero thickness blades) are presented. Both methods are formulated in a frame of reference rigidly rotating at constant angular velocity relative to the ground. Fully unsteady transient analysis is performed by numerical solution of the equations at discrete time steps while a simpler oscillatory unsteady analysis is performed by expressing the potential and its normal derivative as complex Fourier series in time. The wake, treated as a doublet layer, is of prescribed geometry. Numerical results are presented showing a good comparison of the methods (Author)

**A77-48897** Some contributions to aerodynamic theory for vertical axis wind turbines. H Ashley (Stanford University, Stanford, Calif.). In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D C., August 28-September 2, 1977, Proceedings Volume 2. La Grange Park, Ill., American Nuclear Society, Inc., 1977, p 1624-1632. 27 refs. Grant No. AF-AFOSR-74-2712.

A review and modest extensions of quasi-steady aerodynamic theory for performance prediction on Darrieus-type turbines are presented. Results are given for both parallel-axis and curved-blade configurations. Blade stall and variable inflow are neglected; it is hypothesized that unsteady effects support the former approximation down to lower values of tip-speed ratio than hitherto believed. Both profile and induced drag are included, and their influences on power and downwind force are expressed in terms of elliptic integrals. Comparisons are presented with power data from the Sandia 2-meter turbine. Three values of profile drag coefficient are employed, and it is argued that numbers in the range drag coefficient range of 0.015-0.017 are most appropriate to the example chosen. A linearized analysis of unsteady-flow effects on performance is summarized. Calculations suggest that they may be larger than might be expected in view of the low operating reduced frequencies of these machines (Author)

**A77-48898 \*** Experimental data and theoretical analysis of an operating 100 kW wind turbine. B S Linscott, J. Glasgow (NASA, Lewis Research Center, Cleveland, Ohio), W. D. Anderson, and R. E. Donham (Lockheed California Co., Burbank, Calif.). In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D C., August 28-September 2, 1977, Proceedings Volume 2. La Grange Park, Ill., American Nuclear Society, Inc., 1977, p 1633-1650. 8 refs. Contract No. NAS3-20036.

Part of the cooperative effort between NASA and ERDA has been the design and the erection of an experimental wind turbine by the NASA-Lewis Research Center. This 100 kW turbine, designated the Mod-O, is located at the NASA Plum Brook site near Sandusky, Ohio. Experimental test data have been correlated with analyses of turbine loads and complete system behavior of the 100 kW Mod-O wind turbine generator over a broad range of steady state conditions, as well as during transient conditions. The deficit in the ambient wind field due to the upwind tower turbine support structure was found to be very significant in exciting higher harmonic loads associated with the flapping response of the blade in bending (Author)

**A77-48899** Fluid dynamics of diffuser augmented wind turbines. B. L. Gilbert, R. A. Oman, and K. M. Foreman (Grumman Aerospace Fluid Dynamics Laboratory, Bethpage, N Y). In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D C., August 28-September 2, 1977, Proceedings Volume 2. La Grange Park, Ill., American Nuclear Society, Inc., 1977, p 1651-1659. 6 refs. Contract No. E(11-1)-2616.

The Diffuser Augmented Wind Turbine (DAWT) is one of the advanced concepts being investigated to improve the economics of wind energy conversion systems (WECS). Application of modern boundary layer control techniques has reduced the surface area requirements of an efficient diffuser by an order of magnitude. Many parameters that effect the performance of the diffuser system have been examined in small scale wind tunnel tests with a family of compact diffusers, using screens and centerbodies to simulate the

presence of a turbine. Flow field surveys, overall performance, the effect of ground proximity, and the prospects for further improvement are described. The baseline configuration is a conical, 60 deg included angle diffuser with an area ratio of 2.78 controlled by two tangential injection slots. This first generation DAWT can provide about twice the power of a conventional WECS with the same turbine diameter and wind. Economic estimates show that this DAWT can be as much as 50% cheaper than conventional WECS for the same rated power. (Author)

McGowan (Massachusetts, University, Amherst, Mass.). In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D.C., August 28-September 2, 1977, Proceedings Volume 2.

La Grange Park, Ill., American Nuclear Society, Inc., 1977, p. 1668-1675. 6 refs. Contract No. E(49-18)-2365.

**A77-48902** Segmented and self-adjusting wind turbine rotors. P. F. Jordan and R. L. Goldman (Martin Marietta Laboratories, Baltimore, Md.). In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D.C., August 28-September 2, 1977, Proceedings Volume 2.

La Grange Park, Ill., American Nuclear Society, Inc., 1977, p. 1676-1683. 6 refs. Contract No. E(11-1)-2613. An exploration has been made of the concept of aeroelastically self-adjusting rotor blades designed with two goals in mind: one, to keep (at constant rotor RPM) the rotor torque output essentially constant automatically over a large range of wind speeds, two, to have the unsteady aerodynamic forces act as damping forces (rather than as flutter-producing forces). Practical considerations lead to a segmented blade design. The preliminary results concerning both performance and stability of such blades are encouraging. (Author)

**A77-48903** Array power output of non-identical electrical cells. J. Appelbaum, J. Bany, and A. Braunstein (Tel Aviv University, Tel Aviv, Israel). In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D.C., August 28-September 2, 1977, Proceedings Volume 2.

La Grange Park, Ill., American Nuclear Society, Inc., 1977, p. 1686-1692. Energy conversion of electrical cells (photovoltaic, chemical and other cells) are of relatively low power and low voltage levels. The cells are therefore connected in any array to produce the desired power and voltage. The cells are 'nonidentical' in their output parameters, and the parameter dispersions affect the array performance in such a way that the power output is lower than the desired, and hence additional cells have to be added to compensate for the mismatch losses. The paper deals first, in general, with the calculation of array output power of nonidentical cells of any type. A more detailed calculation of the influence of the parameter dispersion on the array output power and the number of cells is given for ideal electrochemical cells. (Author)

**A77-48904** Commercial applications of solar total energy systems. M. G. Boobar, B. L. McFarland, S. J. Nalbandian (Rockwell International Corp., Atomics International Div., Canoga Park, Calif.), and K. E. Smith (Rockwell International Corp., Space Div., Downey, Calif.). In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D.C., August 28-September 2, 1977, Proceedings Volume 2.

La Grange Park, Ill., American Nuclear Society, Inc., 1977, p. 1693-1699. 14 refs. Contract No. E(04-3)-1210.

A methodology has been developed by Atomics International under contract to the Energy Research and Development Administration to define the applicability of solar total energy systems (STES) to the commercial sector (e.g., retail stores, shopping centers, offices, etc.) in the United States. Candidate STES concepts were selected to provide on-site power generation capability, as well as thermal energy for both heating and cooling applications. Each concept was evaluated on the basis of its cost effectiveness (i.e., as compared to other concepts) and its ability to ultimately penetrate and capture a significant segment of this market, thereby resulting in a saving of fossil fuel resources. The photovoltaic STES appears favorable for applications under 800 kWe, whereas the organic Rankine STES would be more cost effective for larger energy demand applications. Initial penetration of these systems are expected to occur in the north-east for large shopping centers in the 1985-1995 time period. (Author)

**A77-48905** Optimum operating conditions for a cylindrical parabolic focusing collector/Rankine power generation cycle system. M. W. Edenburn (Sandia Laboratories, Albuquerque, N. Mex.). In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D.C., August 28-September 2, 1977, Proceedings Volume 2.

La Grange Park, Ill., American Nuclear Society, Inc., 1977, p. 1700-1705. ERDA-supported research.

System operating temperatures, boiler temperatures, boiler pressure, and associated parameters which maximize solar to electric conversion efficiency and which minimize collector/storage/power cycle system cost have been determined for an electrical generation system which uses cylindrical parabolic focusing collectors as a source of heat, a stratified liquid unit for storage, and a Rankine power generation cycle for electrical generation. The study shows that electrical generation efficiency is maximized by using a peak superheat temperature near 635 K, but, when storage cost is considered, the minimum cost system uses a peak superheat temperature near 686 K and a boiler pressure of 2.76 MN/sq m. (Author)

**A77-48906 \*** Gaseous fuel reactors for power systems. J. S. Kendall and R. J. Rodgers (United Technologies Research Center, East Hartford, Conn.). In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D.C., August 28-September 2, 1977, Proceedings Volume 2.

La Grange Park, Ill., American Nuclear Society, Inc., 1977, p. 1706-1715. 19 refs. Contract No. NAS1-14329.

Gaseous-fuel nuclear reactors have significant advantages as energy sources for closed-cycle power systems. The advantages arise from the removal of temperature limits associated with conventional reactor fuel elements, the wide variety of methods of extracting energy from fissioning gases, and inherent low fissile and fission product in-core inventory due to continuous fuel reprocessing. Example power cycles and their general performance characteristics are discussed. Efficiencies of gaseous fuel reactor systems are shown to be high with resulting minimal environmental effects. A technical overview of the NASA-funded research program in gaseous fuel reactors is described and results of recent tests of uranium hexafluoride (UF<sub>6</sub>)-fueled critical assemblies are presented. (Author)

**A77-48907 \*** Space construction base operations in support of solar power satellite development. G. G. McKhann (McDonnell Douglas Astronautics Co., Huntington Beach, Calif.). In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D.C., August 28-September 2, 1977, Proceedings Volume 2.

La Grange Park, Ill., American Nuclear Society, Inc., 1977, p. 1716-1722. Contract No. NAS9-14958.

Development of the Solar Power Satellite (SPS) system for initial operation in the late 1990's requires substantial orbital development activities in the mid-1980's leading to a key system development decision in about 1987. A manned Space Construction Base (SCB) in low-earth orbit is needed to support the SPS orbital development program. The SPS system development issues are defined, along with a candidate development program for resolving

these issues. The development hardware systems of interest for the mid-1980's include (1) a tapered linear array microwave antenna (123 x 125.6 m 'cross') with a 57-kW/rf amplatron output, which is SCB constructed and operated in low-earth orbit initially, and, subsequently, unmanned in geosynchronous earth orbit, and (2) a SCB-constructed and -operated 9 x 14.4 m planar array antenna (358 kW/rf) powered by a 455-kWe silicon photovoltaic solar collector (Author)

**A77-48909** Comparative evaluation of technical and economic indices for MHD and thermionic tappers for steam turbine facilities. G. N. Morozov (Akademiya Nauk SSSR, Nauchno-Issledovatel'skii Institut Vysokikh Temperatur, Moscow, USSR). In Intersociety Energy Conversion Engineering Conference, 12th, Washington, D. C., August 28-September 2, 1977, Proceedings Volume 2. La Grange Park, Ill., American Nuclear Society, Inc., 1977, p. 1733-1739

To attain high efficiency in steam turbine (ST) facilities it is necessary to simultaneously increase the temperature and the pressure of the super heated steam. This is technically very difficult because of the low strengths of structural materials at high temperatures. One of the possible and evidently most promising ways of avoiding the simultaneous effect on the equipment of high temperature and high pressure, is to have the steam cycle augmented by a high temperature cycle operating with a relatively low pressure of working fluid. This paper considers two types of high temperature tappers - thermionic energy converters (TEC) and MHD generators (MHDG) - and on the basis of a comparative analysis makes an evaluation of their technical and economic indices (Author)

**A77-48910** Sharing the sun. Solar technology in the seventies, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976. Volumes 1-10. Conference sponsored by the International Solar Energy Society and Solar Energy Society of Canada. Edited by K. W. Boer (Delaware, University, SES, Inc., Newark, Del.). Vol. 1, 402 p., vol. 2, 404 p., vol. 3, 417 p., vol. 4, 436 p., vol. 5, 561 p., vol. 6, 360 p., vol. 7, 403 p., vol. 8, 381 p., vol. 9, 322 p., vol. 10, 281 p. Price of ten volumes, \$250

Attention is given to the roles of international and inter-governmental agencies and ERDA in developing solar energy technologies and policies. Solar energy technology is discussed with consideration of focusing and flat plate collectors, heating and cooling methods, heat pumps, passive systems, retrofit systems, simulation studies, design methods, low, intermediate, and high temperature thermal energy systems, and ocean thermal energy. Photovoltaic conversion, solar energy materials, bioconversion, wind power, agricultural and industrial process applications, solar storage, chemical storage, and solar heating of buildings are also examined. The socio-economic, cultural, and commercial implications of solar energy are discussed. B. J.

**A77-48911** Present state and perspective of solar energy applications in Mexico. E. R. Mayer (Universidad Nacional Autónoma de México, Consejo Nacional de Ciencia y Tecnología, México City, México). In Sharing the sun. Solar technology in the seventies, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976. Volume 1. Cape Canaveral, Fla., International Solar Energy Society, 1976, p. 37-57. 8 refs.

Geographical and climatological conditions in relation to the population growth are reported. A forecast of the energy consumption and of the availability of nonrenewable resources shows the

necessity of developing alternative energy sources. The potential of solar energy applications is analyzed and the present state of research and development in the different Mexican institutions is reported.

**A77-48912** Overview of Canadian activities in renewable energy resources. E. P. Cockshutt (National Research Council, Ottawa, Canada). In Sharing the sun. Solar technology in the seventies, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976. Volume 1. Cape Canaveral, Fla., International Solar Energy Society, 1976, p. 79-82

The Canadian federal government energy research and development program is outlined. Major projects, arranged in order of priority are (1) energy conservation, (2) maintenance of adequate oil and gas supplies, (3) use of coal as an oil and gas substitute, (4) use of nuclear power, and (5) development of renewable energy sources. More specifically, the development of renewable energy sources is divided into several program topics, such as hydraulic and tidal, solar biomass, wind, and geothermal. International and national cooperative efforts in research programs are briefly noted. S. C. S.

**A77-48913** Development and implementation of standards for solar heating and cooling applications. R. D. Dikkers (National Bureau of Standards, Center for Building Technology, Washington, D. C.). In Sharing the sun. Solar technology in the seventies, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976. Volume 1. Cape Canaveral, Fla., International Solar Energy Society, 1976, p. 83-90. 6 refs.

Solar-energy program activities being conducted by the National Bureau of Standards (NBS) are primarily centered around projects related to the development and implementation of standards and performance criteria for solar heating and cooling applications. In support of the Energy Research and Development Administration (ERDA) and the Department of Housing and Urban Development's (HUD) solar-energy research and demonstration programs, NBS has prepared interim performance criteria for residential solar-energy systems and test procedures for determining the thermal performance of solar collectors and thermal storage devices. Currently, NBS is developing (1) interim performance criteria for commercial solar-energy systems, (2) intermediate standards for solar heating and domestic hot water systems that can be used in conjunction with HUD's minimum property standards, (3) draft standards for materials (i.e., sealants, cover plates, insulation) to be used in solar systems, (4) plans for establishing a solar-collector testing laboratory accreditation program, and (5) plans for identifying and developing other needed standards in cooperation with various standards-writing organizations. (Author)

**A77-48914** Solar residential demonstration program. D. C. Moore (U.S. Department of Housing and Urban Development, Div. of Energy, Building Technology and Standards, Washington, D. C.). In Sharing the sun. Solar technology in the seventies, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976. Volume 1. Cape Canaveral, Fla., International Solar Energy Society, 1976, p. 91-100

As a matter of national policy, the United States is undertaking to bring about the early, widespread use of solar energy for heating and cooling buildings, providing domestic hot water, and supplying heat for industrial and agricultural processes. The residential portion of the national program addresses the many different issues which, together, are involved in developing a residential market for solar energy. Demonstrations of solar heating and cooling systems will provide information on costs, technical performance, public acceptance and potential barriers to widespread use. The first cycle of demonstration grants is currently underway, and a general solicitation has been issued for the second cycle. (Author)

**A77-48915** Recent Canadian activities in solar heating. J. R. Sasaki (National Research Council, Ottawa, Canada). In Sharing the sun. Solar technology in the seventies, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976. Volume 1

Cape Canaveral, Fla., International Solar Energy Society, 1976, p. 106-109

Ongoing Canadian activities in solar heating include a feasibility study on solar heating of buildings in Canada, and six solar-heating demonstration projects. Newly initiated activities include a \$550,000 Federal funding program for encouraging utilization of solar-heating systems in buildings, and the construction of a solar-heated Senior Citizen Home in Ontario. In addition, over a dozen privately-funded solar homes have been and are being constructed in Canada. (Author)

**A77-48916** Recent Canadian activities in wind power. R. S. Rang (National Research Council, Ottawa, Canada). In *Sharing the sun: Solar technology in the seventies*, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976. Volume 1. Cape Canaveral, Fla., International Solar Energy Society, 1976, p. 110-118. 10 refs.

Canadian research and industrial projects involving vertical-axis wind turbines (VAWT) are reviewed. The design of the Magdalen Islands 200 kW VAWT intended to commence operation in October 1976 is examined with attention to test models, planned uses, and expected annual output. The uses of wind power for water supply and as a power source for agricultural equipment in developing countries is considered briefly. The VAWT installed on permanent pack ice in the Beaufort Sea is described, and two sizes of commercially available VAWT are indicated. M. L.

**A77-48917** Recent Canadian activities in biomass. G. E. Timbers and C. G. E. Downing (Agriculture Canada, Engineering Research Service, Ottawa, Canada). In *Sharing the sun: Solar technology in the seventies*, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976. Volume 1. Cape Canaveral, Fla., International Solar Energy Society, 1976, p. 119-125. 13 refs.

Total Canadian biomass production as food, feed, and lumber is an appreciable 145 million tonnes with an estimated additional 43 million tonnes of pasture. Additional biomass production as agriculture and forestry residues adds another 90 million tonnes. The latter materials, with a crude energy content of about 1650 million GJ, can be considered as a possible source of energy or, through processing, as a source of feed. Conversion of waste biomass to feed would increase the efficiency of land use and could allow some conversion of forage land to cereal production to help meet the future world demands. Canadian studies include methane from animal wastes, fuel from forestry and agricultural residues, and residue modification for feeds, including chemical and physical procedures. The contributions of biomass to energy need to be assessed for both direct and indirect effects and studies underway in various areas should aid in the assessment both in terms of conventional and energy economics. **A77-48919** The current technology for solar heating and cooling. F. H. Morse (ERDA, Div. of Solar Energy, Washington, D.C.), J. D. Balcomb, and J. E. Perry, Jr. (California, University, Los Alamos, N. Mex.). In *Sharing the sun: Solar technology in the seventies*, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976. Volume 1. Cape Canaveral, Fla., International Solar Energy Society, 1976, p. 142-150.

The state of the art of solar heating and cooling technology is reviewed for the following areas: solar collectors, thermal energy storage, solar air conditioning and heat pumps, systems and control, and non-technical (economic, social, environmental, etc.) aspects. The following applications of such technology are considered: swimming pools and domestic hot water, service hot water, and the space heating and solar cooling of residences. It is shown that the

major problem associated with such technology still to be addressed is cost effectiveness. The state of the art varies greatly in terms of components and applications, with solar cooling generally less developed than solar heating. B.J.

**A77-48920** Prospectus on commercialization of solar heating and cooling systems. P. D. Maycock, L. O. Herwig, and R. H. Bezdek (ERDA, Div. of Solar Energy, Washington, D.C.). In *Sharing the sun: Solar technology in the seventies*, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976. Volume 1. Cape Canaveral, Fla., International Solar Energy Society, 1976, p. 151-164. 11 refs.

In support of ERDA planning, three contracted studies have been performed to provide background data and projections of demonstration results on solar heating and cooling systems. These studies were carried out by General Electric, Intertechnology Incorporated, and Arthur D. Little Corporation. It was indicated that a total of 600-700 residential and 150-200 commercial demonstrations should be established between 1975 and 1979. Market penetration simulated by these demonstrations is forecast to result in an annual solar installation rate approaching 1% of new building starts by 1980 and 10% by 1985. Annual savings of 0.2 x 10 to the 15th BTU of exhaustible energy resources are estimated to accrue by 1985 and 1.4 x 10 to the 15th BTU by 2000. B.J.

In *Sharing the sun: Solar technology in the seventies*, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976. Volume 1. Cape Canaveral, Fla., International Solar Energy Society, 1976, p. 165-175. 11 refs.

A five year interagency agreement between the Division of Solar Energy of ERDA and the Agricultural Research Service for USDA is designed to develop solar energy systems which will be suitable for application to on-farm thermal energy needs. Annually, proposals are evaluated and recommended for funding by the USDA-ARS to ERDA in the areas of grain and crop drying, the heating of greenhouse/rural residences and livestock shelters. Over 40 projects are currently under way showing how solar energy can provide significant amounts of the heat for the drying of corn, sorghum, soybeans, wheat, rice, tobacco, peanuts and the warming of greenhouses/rural residences and shelters for poultry, swine and dairy cattle. Some of the systems are already showing economic soundness when compared with conventional fuels, while others, such as grain drying, will require that the solar systems are used for multiple purposes to justify their initial investment cost. (Author)

**A77-48922** ERDA Solar Thermal Energy Program for industrial process heat. W. W. Auer and W. R. Cherry (ERDA, Div. of Solar Energy, Washington, D.C.). In *Sharing the sun: Solar technology in the seventies*, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976. Volume 1. Cape Canaveral, Fla., International Solar Energy Society, 1976, p. 176-185. 6 refs.

To encourage the application of solar energy to industrial processes, ERDA has implemented a phased program of solar system application experiments and demonstrations to show the potential for supplying a significant amount of industrial energy, thus reducing U.S. dependency on fossil fuels. Included in the program are surveys to identify those industries and processes where solar thermal energy systems are technically and economically feasible. Four industrial process hot water and six drying/dehydration applications are presently in Phase I analysis and design activity. In addition, a shallow solar pond prototype system for supplying hot water to an uranium milling plant is in operation. (Author)

**A77-48923** Summary of the role of planning and analysis in the development of the Federal solar energy program. L. O. Herwig (ERDA, Div. of Solar Energy, Washington, D.C.). In *Sharing the sun: Solar technology in the seventies*, Proceedings of the Joint

Conference, Winnipeg, Canada, August 15-20, 1976 Volume 1  
Cape Canaveral, Fla., International Solar Energy  
Society, 1976, p 189-210 60 refs

The main purpose of this paper is to describe the scope of planning and analysis and summarize the projects that have guided the growing Federal efforts to develop solar energy technologies. Planning and analysis includes studies involving mission analysis, comparative system evaluation, application selection, preliminary system design, and engineering and economic evaluation. As planning methodology has evolved and expanded over the past three to five years, the results of the planning studies have influenced direction, content, schedule and goals of the Federal solar energy program. A review is given of planning projects in each of a large number of important subprogram areas of solar technology research, development and demonstration. References to the results of these planning studies are given as they are now available (Author)

**A77-48924** The climatology of available solar energy for Canada J E Hay (British Columbia, University, Vancouver, Canada) In Sharing the sun Solar technology in the seventies, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976 Volume 1 Cape Canaveral, Fla., International Solar Energy Society, 1976, p 211-225 10 refs  
Research supported by the National Research Council and Department of the Environment of Canada

It is shown that in mid-winter months in Canada, there is a large relative difference in the radiation environment of a surface which is horizontal and one which is steeply sloping and south-facing. Data for eight southern Canadian locations are analyzed to show optimum solar-collector orientation (tilt and aspect) and the sensitivity to deviations from the optimum. It is found appropriate, without long-term storage, to optimize for mid-winter situations. The ultimate value in available solar energy is determined by using a tracking surface, this configuration showing little improvement over a steeply sloping south-facing surface in mid-winter. By increasing the reflectivity of the ground immediately in front of the collector, it is possible to produce a substantial increase in the total short-wave radiation collected B J.

**A77-48930 \*** Insolation data for solar energy conversion derived from satellite measurements of earth radiance M P Thekaekara (NASA, Goddard Space Flight Center, Greenbelt, Md.) In Sharing the sun Solar technology in the seventies, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976 Volume 1 Cape Canaveral, Fla., International Solar Energy Society, 1976, p 313-328

Detailed knowledge of the irradiance of the sun at ground locations is essential for the design and evaluation of solar energy conversion systems. The primary source of such data is the global network of weather stations. Such stations are often too far apart and for most locations the data available are only daily total irradiance or monthly averages. Solar energy conversion programs require insolation data with considerably higher geographical and temporal resolution. Meteorological satellites gather routinely extensive data on the energy reflected and scattered into space by the earth-atmosphere system. A program has been initiated to use such data for deriving ground insolation for energy conversion. Some of the preliminary results of this program will be discussed (Author)

This paper presents the results of investigations made experimentally and theoretically to evaluate the various parameters that affect the amount of solar energy received on a collector surface. Measurements were made over a long period of time using both pyranometer and pyrhelometer. Computation of spectral and total irradiance at ground level have been made for a large variety of combinations of atmospheric parameters: for ozone density, precipitable water vapor, turbidity-coefficients and air mass. A study of the air mass as a function of irradiance measured at GSFC, and comparison of the data with the computed values of total direct solar irradiance for various parameters indicate that turbidity changes with time of the day, atmospheric opacity is less in the afternoon than in the morning (Author)

**A77-48933** Determination of average ground reflectivity for solar collectors. B D Hunn and D O Calafell, II (Clarkson College of Technology, Potsdam, NY) In Sharing the sun Solar technology in the seventies, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976 Volume 1  
Cape Canaveral, Fla., International Solar Energy Society, 1976, p 356-362 6 refs

This paper presents a systematic method for the determination of average ground reflectivities for solar collectors which view a wide variety of landscapes. The method is based on photographs of representative landscapes taken with an 8-mm, 2.8 Fisheye Nikkor lens used to simulate the field of view seen by a tilted flat-plate collector. Results are reported for an application of the method to 12 representative winter landscapes. An average ground reflectivity of 0.6-0.7 is determined to be accurate for most rural landscapes in winter where snow cover is predominant, except for locations adjacent to open bodies of water where a considerably lower reflectivity is obtained. For urban areas in winter the range of ground reflectivity is 0.16-0.49, depending greatly upon the landscape composition. (Author)

**A77-48934** Methods for estimating total flux in the direct solar beam at any time L. L. Vant-Hull (Houston, University, Houston, Tex.) In Sharing the sun Solar technology in the seventies, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976 Volume 1. Cape Canaveral, Fla., International Solar Energy Society, 1976, p 369-375 6 refs  
NSF Grant No. GI-394J6

Most models used for estimating available solar beam energy are relatively cumbersome to use because they consider the detailed spectral character of the attenuation process. If such information is not of interest, several short tabulations giving the direct beam intensity for a few elevation angles are available. A number of such tabulations are fitted with analytic functions. These functions may be easily evaluated for any solar elevation (and in one case, as a function of precipitable water overhead). The resulting functions fit most of the tabulated data to about + or - 0.5% in absorptivity, allow convenient interpolation between the tabulated points, and are designed to behave reasonably under extrapolation (Author)

Current research and development activity on solar collectors for heating and cooling of buildings is reviewed. Topics covered include reduction to practice, fundamentals of flat plate collectors, collector testing, selective surfaces, heat reflecting glass, honeycomb collectors, evacuated collectors, and concentrating collectors of the V-trough, compound parabolic, and linear Fresnel lens types (Author)

**A77-48936** Thermic diode solar panels - A brief summary S Buckley (MIT, Cambridge, Mass.) In Sharing the sun Solar technology in the seventies, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976 Volume 2

Cape Canaveral, Fla., International Solar Energy Society, 1976, p 1-23 Research supported by the Cabot Solar Energy Fund, NSF, and ERDA

Thermic diode solar panels for use in heating buildings are described Each panel combines all the necessary elements of a complete solar energy system (collector, controls, storage, heat exchangers and ducting) into a four by eight foot module No moving parts or external power are involved Thermic panels are also compared to other solar heating systems, such as air heating and water heating The economics of thermic panels are determined using a computer simulation of a typical house under actual weather conditions for eight different climate types The resultant heat savings over the life of the panel are compared to the panel's installed cost The panels are found to be economic in some areas of the country even under the most conservative projections involving oil heating at constant real energy costs (Author)

**A77-48937** The use of planar reflectors for increasing the energy yield of flat-plate collectors S L Grassie and N R Sheridan In Sharing the sun Solar technology in the seventies, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976 Volume 2 Cape Canaveral, Fla., International Solar Energy Society, 1976, p 24-38 5 refs Research supported by the University of Queensland and Texas Tech University

A mathematical model to simulate the performance of flat-plate collector-reflector systems is presented First the collector energy balance is modified to account for the reflected energy Then the exchange area for a diffuse reflector is obtained by integrating over both reflector and collector surfaces For the specular reflector, the collector area exposed to reflected radiation is calculated from geometrical relations Shading effects are also found from the system geometry Fair agreement is obtained between the model and some experiments on a water heating collector in Brisbane, Australia. Finally, the model is used to predict the annual performance of a water heating system with several values of the reflector angle (Author)

**A77-48939** Performance and analysis of 'Solaris' water-trickle solar collector J T Beard, F A Iachetta, L U Lilleleht (Virginia, University, Charlottesville, Va.), F L Huckstep, and W. B May, Jr In Sharing the sun Solar technology in the seventies, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976 Volume 2 Cape Canaveral, Fla., International Solar Energy Society, 1976, p 46-63 16 refs. Contract No E(40-1)-4927

An outdoor solar collector test facility has been designed and constructed for performance evaluation of Thomason 'Solaris' water-trickle solar collector panels Two full-size (1 2 m by 4 9 m) collector panels are tested simultaneously on each of two test stands, so that various design and operational variables are evaluated under the same ambient conditions The test facility design and its operation are based on the 'Method of Testing for Rating Solar Collectors Based on Thermal Performance' recommended by the National Bureau of Standards Results are compared to published results of other single- and double-glazed flat-plate collectors A method is also developed for using performance results for design applications (Author)

**A77-48940** Performance of an evacuated tubular collector using non-imaging reflectors G R Mather, Jr and D C Beekley (Owens-Illinois, Inc., Toledo, Ohio) In Sharing the sun Solar technology in the seventies, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976 Volume 2

Cape Canaveral, Fla., International Solar Energy Society, 1976, p 64-78

Specular reflectors have been found to improve significantly the performance of the Owens-Illinois evacuated tube collector Two types of specular reflectors, both of which are nonimaging and result

in moderate concentration ratios, have been investigated in detail Both collect diffuse light efficiently, and neither requires tracking of the sun The results of optical analysis and experimental tests of the two reflectors are described, and compared with similar results for the diffuse reflector used with present Owens-Illinois tubular collectors Energy outputs of the collector are found to increase by 25-35% when the diffuse reflector is replaced with either of the specular reflectors (Author)

**A77-48941** A method of comparing flat-plate air and liquid solar collectors for use in space heating applications. R. L. Oonk, G O G Lof, L. E Shaw, and B. E. Cole-Appel (Solaron Corp., Commerce City, Colo.) In Sharing the sun Solar technology in the seventies, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976, Volume 2 Cape Canaveral, Fla., International Solar Energy Society, 1976, p. 83-93. 8 refs.

An investigation is conducted concerning a suitable approach for comparing the performance of different types of solar heating systems. In the liquid collector system considered, an antifreeze solution passes through the collector and transfers the solar energy which it received to a second fluid loop (usually water). In the typical air system, heated air from the collector is directed either to the space for heating or to a pebble bed storage. In the traditional method, the collector efficiency is plotted against a parameter obtained by dividing the difference between the collector inlet temperature and the ambient temperature by the solar radiation incident on the collector plane per unit area. It is found that this traditional plot is not useful in the considered comparison. A useful comparison technique should include the effects of other system components which contribute to system performance. G.R.

**A77-48942** Performance of air-cooled flat plate collectors B E Cole-Appel (Solaron Corp., Denver, Colo.) and R D. Haberstroh (Colorado State University, Fort Collins, Colo.) In Sharing the sun Solar technology in the seventies, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976 Volume 2 Cape Canaveral, Fla., International Solar Energy Society, 1976, p 94-106 17 refs

An analytical scheme using a simple linear model is employed to compare the thermal performance of five flat-plate solar air heater designs The air heaters differ with respect to the location of their flow channel, which may be above and/or below the absorber plate. In addition two of the air heater designs studied have area added to the absorber plate in the form of fins Performance curves are found for the different collector designs by solving the sets of simultaneous equations obtained from the energy balances on the collector components The efficiency of a solar flat-plate collector, defined as the amount of useful energy collected per unit area divided by the insolation, can be improved by five to ten percent if fins are added to the flow-side of the absorber plate An optimum fin spacing based on a fin density was found to be dependent on solar flux and mass flow rate For the long fins studied, it appears that a fin density greater than 10 to 20 fins per inch does not significantly improve performance (Author)

**A77-48943** Predicted daily and yearly average radiative performance of optimal trapezoidal groove solar energy collectors. R B Bannerot and J R Howell (Houston, University, Houston, Tex.) In Sharing the sun Solar technology in the seventies, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976 Volume 2 Cape Canaveral, Fla., International Solar Energy Society, 1976, p 111-124 8 refs ERDA-supported research

**A77-48944** A heat transfer criterion on the geometric configuration of flat solar water heaters S Lin (Concordia University, Montreal, Canada) In Sharing the sun Solar technology in the seventies, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976 Volume 2 Cape Canaveral, Fla., International Solar Energy Society, 1976, p 129-137

The concept of using extended surface for increasing overall heat transfer coefficient is not applicable to the sheet-and-tube type of solar absorber. The available heat transfer surface of a sheet-and-tube solar absorber is not effectively used. An outline of an effective heat transfer solar absorber is proposed. (Author)

D L Spencer, T F Smith, and D E Laughlin (Iowa, University, Iowa City, Iowa) In Sharing the sun Solar technology in the seventies, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976 Volume 2 Cape Canaveral, Fla., International Solar Energy Society, 1976, p 146-159

**A77-48946** A proposed method of rating the thermal performance of solar collectors B W Tlemat, E D Howe, and R E Buckland (California, University, Richmond, Calif.) In Sharing the sun Solar technology in the seventies, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976 Volume 2 Cape Canaveral, Fla., International Solar Energy Society, 1976, p 160-172 11 refs

The majority of the performance data on solar collectors in the current literature show the instantaneous efficiency of the collector, as suggested by Whillier (1961) and elaborated by Hill and Kusuda (1974) for the National Bureau of Standards (NBS). It is proposed that, in addition to the NBS interim method, collector performance be measured and displayed in a manner similar to that of solar stills, diurnal efficiency would be plotted as a function of diurnal solar radiation intensity incident on the plane of the collector, with the temperature difference between the fluid in the collector and ambient air used as a parameter. Furthermore, it is proposed that a selected collector be tested over an extended period of time and under a variety of conditions of tilt angle and other variables so that its performance can be well charted. It would then be used as a standard for comparison purposes. (Author)

**A77-48947** A site sensitive solar collector evaluator R E Ferguson (Teledyne Brown Engineering, Huntsville, Ala.) In Sharing the sun Solar technology in the seventies, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976 Volume 2 Cape Canaveral, Fla., International Solar Energy Society, 1976, p 173-192 5 refs

A digital simulation model has been developed to act as an analysis tool in design and optimization studies of solar collector subsystems. Since many factors governing the collector performance are directly affected by the collector location and orientation, equal emphasis is placed on the definition of the energy processes within the collector and environmental forcing functions. Collector performance parameters are based on a day of operation rather than the often misleading instantaneous performance. (Author)

**A77-48948** Use of calculated displaced shapes to define the reflected light pattern from a focused collector. C S Hoyle (Sandia Laboratories, Livermore, Calif.) In Sharing the sun Solar technology in the seventies, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976 Volume 2 Cape Canaveral, Fla., International Solar Energy Society, 1976, p 208-219

A program has been developed to analyze the reflected light pattern from slightly curved flat plate collectors. The deflected shapes of the mirrors can be defined by means of finite-element calculations or analytical expressions. The current version allows the comparison of the reflected light patterns from an externally defined shape, a spherical shape, or either of two round plate analytical solutions. Besides the deflected shape of the mirror, the input includes the direction of the light source and the distance to the focusing point of interest. The resulting reflected light pattern is plotted as it would appear on a plane at the specified position. The program also has the capability to search for the minimum reflected spot size. (Author)

**A77-48949** Mathematical modeling of solar concentrators F Biggs and C N Vittitoe (Sandia Laboratories, Albuquerque, N Mex.) In Sharing the sun Solar technology in the seventies, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976 Volume 2 Cape Canaveral, Fla., International Solar Energy Society, 1976, p 220-234

A computational capability that models the operation of any solar energy collector that uses flux concentrators is a valuable aid in the planning, design, construction, calibration, safety analysis, and operation of the system. In addition to the usual optical considerations, the model should treat such imperfections as reflecting-surface slope errors, sun-tracking and alignment errors, and mirror-focusing errors. It should properly account for the angular distribution of incoming sun rays and the effects of atmospheric transmission on this distribution. A model with these capabilities is described, and two computer programs for implementing it are illustrated. (Author)

**A77-48950** Design considerations for parabolic-cylindrical solar collectors. G W Treadwell (Sandia Laboratories, Albuquerque, N Mex.) In Sharing the sun Solar technology in the seventies, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976 Volume 2 Cape Canaveral, Fla., International Solar Energy Society, 1976, p 235-252

The design of a parabolic-cylindrical solar collector using a commercial organic heat transfer liquid in uniflow receivers is discussed. In particular, the geometry and size of the reflector system is considered, the characterization of slope errors on parabolic surfaces, the determination of optimal outer tube diameters for the receivers, as well as difficulties associated with solar tracking, are treated. The influence of asymmetric fluid heating on the design of the collector system is also reviewed. Several techniques for increasing the efficiency of energy distribution through the collector fluid, including the use of internal rods to promote annular flow or the use of copper receiver tubes to transfer energy circumferentially, are mentioned. J M B

**A77-48951** Reduced drag, paraboloid type, solar energy collectors P J Vermeulen (Calgary, University, Calgary, Alberta, Canada), A Bader, and P Elfner In Sharing the sun Solar technology in the seventies, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976 Volume 2

Cape Canaveral, Fla., International Solar Energy Society, 1976, p 264-274

The design and development of two paraboloid-type solar energy collectors of reduced wind drag is presented. The designs are aimed at reducing drag forces from winds nominally from the lateral and the frontal direction. The designs consist essentially of conical frusta mounted to produce a front-focus mirror in one case and a rear-focus mirror in the other. The frusta are mounted so that annular gaps for air flow are presented laterally in the first and frontally in the second. In the first design, interference by the focal-plane energy-receiver device produces the usual collector area loss, but in the second design there is no such interference loss. Wind-tunnel models of both designs have been tested, and the resulting drag-force data are presented and discussed. The data show that significant drag reduction is possible. A 0.914-m dia prototype of the front-focus design has been constructed, and the results of calorimetric measurements are presented. (Author)

**A77-48952 \*** An analytical and experimental evaluation of the plano-cylindrical Fresnel lens solar concentrator L J Hastings, S L Allums (NASA, Marshall Space Flight Center, Huntsville, Ala.), and R M Cosby (Ball State University, Muncie, Ind.) In Sharing the sun Solar technology in the seventies, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976 Volume 2 Cape Canaveral, Fla., International Solar Energy Society, 1976, p 275-290 5 refs

Plastic Fresnel lenses for solar concentration are attractive because of potential for low-cost mass production. An analytical and experimental evaluation of line-focusing Fresnel lenses with application potential in the 200 to 370 C range is reported. Analytical

techniques were formulated to assess the solar transmission and imaging properties of a grooves-down lens. Experimentation was based primarily on a 56 cm-wide lens with f-number 1.0. A sun-tracking heliostat provided a non-moving solar source. Measured data indicated more spreading at the profile base than analytically predicted. The measured and computed transmittances were 85 and 87% respectively. Preliminary testing with a second lens (1.85 m) indicated that modified manufacturing techniques corrected the profile spreading problem. (Author)

**A77-48953** Characteristics of the concentrated solar flux produced by the FMSC prototype. S. Y. Harmon, C. E. Backus, and R. Pinón (Arizona State University, Tempe, Ariz.). In *Sharing the sun. Solar technology in the seventies, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976. Volume 2*. Cape Canaveral, Fla., International Solar Energy Society, 1976, p. 291-303.

Intensity profiling showed the focal zone of the Fixed Mirror Solar Concentrator (FMSC) to have a fairly well-defined symmetrical focus. The intensity in the focal zone varied a maximum of thirty percent along the z-axis of the concentrator. Radiometric analysis indicated a large part of the flux in the focal zone to be within a width of 2 cm. Further studies using larger absorbing surfaces supported this result by showing that seventy percent of the flux incident on an absorber approximately 10 cm wide fell within a strip 2 cm wide. It is suggested that secondary reflectors could significantly improve the performance of this concentrator. These conclusions were further supported by the results gained when comparing the performance of a solar cell array one cell wide with that of an array two cells wide. Work with solar cell arrays indicates the FMSC to be capable of producing concentration ratios of around twenty. (Author)

**A77-48954** The performance of a stationary reflector/tracking absorber solar concentrator. A. M. Clausen. In *Sharing the sun. Solar technology in the seventies, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976. Volume 2*. Cape Canaveral, Fla., International Solar Energy Society, 1976, p. 304-326. 7 refs.

A fixed segment of a concave, spherical mirror can be used to concentrate beam radiation onto a tracking absorber which pivots about the center of curvature of the mirror. A possible economic advantage of the system over concentrating collectors with tracking mirrors is reduced mirror cost. The characteristics of this system are analytically studied. The strong influences of the rim angle of the spherical segment, the angle of incidence of the rays of the sun, and the absorber temperature are established. The role of other important parameters is also determined. Using the efficiency of a Carnot cycle, the daily and yearly variations of the power produced by the system are presented. (Author)

**A77-48955** Collector with cusplike compound parabolic concentrator and selective absorber. A. Rabi (Argonne National Laboratory, Argonne, Ill.). In *Sharing the sun. Solar technology in the seventies, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976. Volume 2*. Cape Canaveral, Fla., International Solar Energy Society, 1976, p. 327-335. 15 refs. ERDA-supported research.

A nonevacuated solar collector with a cusplike compound parabolic concentrator (CPC) and tubular absorber has been built. Since the reflector surrounds the absorber on all sides, little insulating material is needed. Furthermore, the quantity of absorber material relative to unit collector aperture is smaller than in any other collector of comparable acceptance angle. This feature optimizes both transient response and heat transfer from absorber surface to fluid. The collector has been constructed as a panel 90 cm x 180 cm with seven parallel CPC troughs, approximately 20 cm deep. The 0.64-cm OD absorber tubes have been coated with black chrome. The concentration ratio (aperture/tube perimeter) is 6.5, and the acceptance angle is 13 deg, necessitating only seasonal tilt adjustments. Optical efficiency of 60% and U-values around 1.6 W/sq m-C have been measured with individual reflector modules, in-

dicating that the complete collector can operate with 44% efficiency at plate temperatures 100 C above ambient. (Author)

**A77-48956** Optical and thermal design considerations for ideal light collectors. N. B. Goodman, R. Winston (Chicago, University, Chicago, Ill.), and A. Rabi (Argonne National Laboratory, Argonne, Ill.). In *Sharing the sun. Solar technology in the seventies, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976. Volume 2*. Cape Canaveral, Fla., International Solar Energy Society, 1976, p. 336-350. 13 refs.

The design of practical compound parabolic solar concentrators is discussed. Problems associated with the gap needed between reflectors and absorbers to reduce conductive heat losses are assessed, several types of ideal light collectors with diminished absorbers surrounded by glass tubes, with truncated reflectors to create a gap between the reflector and the receiver, or with the receiver modified to form a radiation cavity, are described. Use of a second-stage concentrator in solar or photovoltaic systems is also considered. Advantages of the two-stage systems include more uniform flux distribution and increase in the concentration factor. In addition, prescriptions for maximizing the concentration factors of lens-mirror combination concentrators are given. J. M. B.

**A77-48957** Solar process heat from concentrating flat-plate collectors. D. P. Grimmer (California, University, Los-Alamos, N. Mex.) and K. C. Herr (Aerospace Corp., El Segundo, Calif.). In *Sharing the sun. Solar technology in the seventies, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976. Volume 2*. Cape Canaveral, Fla., International Solar Energy Society, 1976, p. 351-374. 18 refs. ERDA-sponsored research.

The use of solar energy in the form of process heat for industrial, commercial and utility applications in the United States is discussed. Compound parabolic concentrating collectors, which achieve high collection efficiencies with minimum solar tracking, are proposed as solar energy sources, an analysis suggests that compound parabolic concentrator systems operating at temperatures of 250 C could furnish as much as 39.6% of the 1975 national Gross Energy Input (GEI). Furthermore, it appears that current technology evacuated compound parabolic concentrating collectors could supply nearly half the 1975 national GEI. Economic considerations and the design of compound parabolic concentrators for industrial applications are also considered. J. M. B.

**A77-48958** A compound parabolic concentrator array optimized for northern climates. M. L. Stein (DeBell and Richardson Testing Institute, Enfield, Conn.). In *Sharing the sun. Solar technology in the seventies, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976. Volume 2*. Cape Canaveral, Fla., International Solar Energy Society, 1976, p. 375-387. 6 refs.

The radiative exchange between collector and source sets the limit for efficient collector operation. When actual insolation conditions and performance requirements are considered for northern latitudes, the compound parabolic concentrator is shown to perform better than the flat plate since it approaches the limit for optimum radiative exchange. The relationship between concentration and acceptance angle is analyzed for its effect on the collector's overall thermal performance. The resulting collector is compared with an equivalent flat-plate type. (Author)

**A77-48959** Heating of buildings with solar energy. G. O. G. Lof (Colorado State University, Fort Collins, Colo.). In *Sharing the sun. Solar technology in the seventies, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976. Volume 3*. Cape Canaveral, Fla., International Solar Energy Society, 1976, p. 1-12.

The presented review on the solar heating of buildings includes a brief description of the principal types of solar heating systems, an indication of their degree of commercialization, and an evaluation of current and near-future economic factors. Attention is given to solar heating with liquid collectors and hot water storage, solar heating with air collectors and pebble-bed storage, systems with combined

collector-storage unit, systems with high efficiency utilizing special design features, and solar heating prospects and impacts. It is concluded that the solar heating industry will experience an enormous growth during the next two decades. G R

**A77-48961** Parametric study of a dynamic solar powered absorption cycle. R W Allen and D K. Anand (Maryland, University, College Park, Md.) In *Sharing the sun Solar technology in the seventies*, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976 Volume 3. Cape Canaveral, Fla., International Solar Energy Society, 1976, p 27-43 10 refs Contract No E(40-1)-4976

The performance of a solar powered absorption cycle is simulated taking into consideration the internal heat transfer characteristics and the floating of the generator/condenser/evaporator/absorber temperatures. A parametric analysis for capacity and cut-off temperatures is conducted. The daily and seasonal system coefficient of performance and capacity delivered at the evaporator is obtained with the use of real weather data. (Author)

**A77-48962** Performance of an air-cooled ammonia-water absorption air conditioner at low generator temperatures. K. Dao, M Simmons, R Wolgast, and M Wahlig (California, University, Berkeley, Calif.). In *Sharing the sun Solar technology in the seventies*, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976 Volume 3. Cape Canaveral, Fla., International Solar Energy Society, 1976, p. 46-52

The paper describes an experimental air-cooled ammonia-water absorption air conditioning system for the study of operational stability near the cut-off conditions, and designed to operate at temperatures compatible with the temperature range of flat-plate solar collectors. Three temperature ranges were tested, and circulation ratios were from 8 to 30. Construction procedures for the air conditioner and generator are described. It was concluded that with a heat source temperature below 200 F and a heat sink temperature (using air cooling) below 110 F, the ammonia-water absorption cycle may be used for cooling. Future applications of the project, both for cooling and heating purposes, are outlined. S.C.S

**A77-48963** Modelling of a solar-operated absorption air conditioner system with refrigerant storage. S L Grassie and N R Sheridan. In *Sharing the sun Solar technology in the seventies*, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976 Volume 3. Cape Canaveral, Fla., International Solar Energy Society, 1976, p 53-67 15 refs

A detailed dynamic model of a solar air conditioning system is reported. The model, including the solar collector and cooling tower, is described in terms of design parameters. Ambient wet and dry bulb temperatures and solar radiation are the required inputs. System temperatures, energy flows and coefficient of performance can be predicted. Careful attention is given to the evaporator model and the control of refrigerant flow. Typical performance results are discussed. Finally several recommendations for future investigations are made. (Author)

**A77-48964** Cooling subsystem design in CSU Solar House III. D S Ward, G O G Löf (Colorado State University, Fort Collins, Colo.), and T Uesaki (Yazaki Parts Co., Kosai, Shizuoka, Japan). In *Sharing the sun Solar technology in the seventies*, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976 Volume 3. Cape Canaveral, Fla., International Solar Energy Society, 1976, p 68-89

The use of cool storage in conjunction with lithium bromide absorption chillers allows for improved operating conditions of the cooling subsystem. Significant performance degradation in the absorption cooling capacity is evident whenever the chiller cycles on and off during periods of low cooling demand. The capability of providing storage for the chiller output prevents short-term cycling of the absorption machine and significantly improves the seasonal average coefficient of performance of the cooling subsystem. Cool storage can also be utilized to allow for a lower cooling capacity of the absorption unit (lower tonnage), without decreasing the ability

of the subsystem to meet the cooling demands of the building. The size of cool storage can, in fact, be optimized by evaluating the ability of the cool storage component to prevent cycling of the absorption machine and in meeting the cooling demands on a smaller tonnage chiller. (Author)

**A77-48965** Coefficient of performance for solar-powered space cooling systems. H M Curran (Hittman Associates, Inc., Columbia, Md.). In *Sharing the sun Solar technology in the seventies*, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976 Volume 3. Cape Canaveral, Fla., International Solar Energy Society, 1976, p 90-98 Contract No E(11-1)-2703

This paper proposes a common basis for defining coefficient of performance (COP) for diverse cooling systems which are wholly or partially driven by solar energy. Such a common basis would permit more meaningful comparisons between different systems. Possible energy inputs for different solar-powered cooling systems are identified and incorporated into a generalized energy balance diagram. The proposed energy balance boundary for a COP computation basis includes the solar-powered cooling machine and heat rejection equipment and excludes the solar collector/storage system and the building circulation system. The COP is defined as the ratio of the cooling load rate to the sum of all energy input rates across the boundary. The recommended approach is to compute COP with respect to a set of psychrometric conditions related to the cooling load. (Author)

**A77-48966** A solar heated and cooled office building. S Diamond, C Packard, R L San Martin, H Shaw, and W Stevens (New Mexico State University, Las Cruces, N Mex.). In *Sharing the sun Solar technology in the seventies*, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976 Volume 3. Cape Canaveral, Fla., International Solar Energy Society, 1976, p 99-105. Research supported by the New Mexico State Energy Research and Development Program and ERDA.

The solar heating and cooling system for the New Mexico Department of Agriculture building is described. The total area of the solar collectors is 6730 square feet, consisting of Sunsource flat plate collectors and Northrup concentrating collectors. A schematic drawing of the integrated solar heating and cooling systems is included along with a discussion of hot and cold water storage and the building's heating and cooling loads. The basic components of the project's computer-based instrumentation system are listed and explained, such as the interconnection of the computer and remote stations with a bi-directional digital bus, and the so-called mini-computer, the nucleus of the instrumentation system. S.C.S

**A77-48967** Comparative performance of solar heating with air and liquid systems. G O G Löf, S Karaki, and C C Smith (Colorado State University, Fort Collins, Colo.). In *Sharing the sun Solar technology in the seventies*, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976 Volume 3. Cape Canaveral, Fla., International Solar Energy Society, 1976, p 106-117

A performance comparison between an air solar system and a liquid solar system for space heating under nearly equal conditions has been obtained. The Colorado State University Solar House I is a liquid solar system which has been in operation since August 1974. Solar House II, which stands adjacent to and has a comparable heating load to Solar House I, was equipped with an air solar system. The two solar houses were operated and monitored during most of the 1975-1976 heating season. Performance of the solar system is reported in terms of the collector efficiency, the amount of space heating load provided by solar energy, and the use of electrical energy to operate the solar equipment. General characteristics of the two types of systems are also compared. Information concerning installation, operation, and maintenance of the systems have been documented and are discussed. (Author)

**A77-48968** Experimental evaluation of a solar house heating system in Quebec. B Hamilton (McGill University, Montreal,

Canada) and R. McConnell (Hydro-Québec, Institut de Recherche, Varennes, Canada) In *Sharing the sun Solar technology in the seventies, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976 Volume 3* Cape Canaveral, Fla., International Solar Energy Society, 1976, p 120-135 12 refs

An experimental house employing a low-cost solar heating system has been built 170 km north of Montreal. The solar collector is a vertical air heater which covers the south wall of the house (37 sq m). A screen of expanded metal is located in front of the flat metal absorbing plate and a fan forces air through the collector to a storage bin filled with rocks. Air is distributed into the living space through baseboard diffusers. All supplementary heat is provided electrically. The heating system is being extensively monitored for at least one year. A 60-channel data acquisition system records data from thermocouples mounted throughout the system, from meteorological instruments, and from sensors installed in the electrical circuits. Preliminary results of performance are presented (Author)

**A77-48969** **Application of solar principles in designing a low cost system for warehouse heating** L R Mast (H A Williams and Associates, Inc., Columbus, Ohio) In *Sharing the sun Solar technology in the seventies, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976 Volume 3*

Cape Canaveral, Fla., International Solar Energy Society, 1976, p 138-146 Research supported by Ruscilli Construction Co. and Distribution Centers

Adapting pre-engineered industrial building wall panels to an air type collector offers a low cost solution for low temperature warehouse heating. A prototype system was designed which utilized the existing building wall as an absorber, and added a fiberglass cover over wood furring strips. At 40 F entering fluid temperature, the panels would produce a 20 deg rise. The entire 3000 square foot solar system with fans, ducts, dampers, etc., is estimated at \$11,000 and will save 60 million Btu's annually. This would realize a 10 year pay back at current electric rates (Author)

**A77-48970** **A solar home for low income families** H Ashcroft, R Clark, and H Wade (Apache County Self-Help Housing, Springerville and Flagstaff, Ariz.) In *Sharing the sun Solar technology in the seventies, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976 Volume 3*

Cape Canaveral, Fla., International Solar Energy Society, 1976, p 147-152

The construction of a solar home for low-income families is presented with reference to a model site in Arizona. Cross-sectional and floorplan diagrams of the structure are included along with a discussion of the locations of solar heating components. Specific considerations of construction materials are outlined and the special truss design to carry the collector and the hot air plenum is described. The project's sensor instrumentation, and back up heat system are explained SCS

**A77-48971** **Lessons learned from Atlanta /Towns/ solar experiment** A Weinstein, R T Duncan, Jr., and W C Sherbin (Westinghouse Electric Corp., Special Systems Div., Baltimore, Md.) In *Sharing the sun Solar technology in the seventies, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976 Volume 3* Cape Canaveral, Fla., International Solar Energy Society, 1976, p 153-167

A large-scale solar heating and cooling system experiment was designed and constructed for the Towns Elementary School, Atlanta, Georgia. This system involved 10,360 square feet of flat-plate collectors, 10,800 square feet of flat reflectors and a 100 ton absorption chiller. The lessons learned and the performance of the systems in the heating mode since initiation of operation is described (Author)

**A77-48973** **Solar cooling of a Florida Welcome Station - A demonstration** O G Hancock, Jr., H P Harrenstien, and G W Lowery (Florida Solar Energy Center, Cape Canaveral, Fla.) In *Sharing the sun Solar technology in the seventies, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976 Volume 3*

Cape Canaveral, Fla., International Solar Energy Society, 1976, p 190-199 ERDA-supported research

One of two commercial solar heating and cooling demonstration projects supported by ERDA in Florida is under construction at the Visitor Welcome Station on Interstate Highway 95 north of Jacksonville. The 3300 square-foot Welcome Station will be retrofitted with a 25-ton absorption chiller to take most of the load from the existing conventional air conditioner. Twenty seven hundred square feet of tracking, concentrating collectors using linear Fresnel lenses will be mounted on the ground away from the building. To drive the air conditioner during short sunless periods solar heated water will be stored in a 10,000 gallon tank. An anticipated 88 percent of the cooling load will be furnished by the solar system when it is completed early in 1977. Instrumentation will be included to compare performance with design conditions and to acquire solar irradiance design data for that geographical area (Author)

**A77-48974** **The Shenandoah Solar Community Center** J R Williams and J I Craig (Georgia Institute of Technology, Atlanta, Ga.) In *Sharing the sun Solar technology in the seventies, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976 Volume 3* Cape Canaveral, Fla., International Solar Energy Society, 1976, p 200-212 7 refs ERDA-supported research

A solar energy system which is part of a building scheduled for completion later this year is discussed. The 5017 sq m building will incorporate 1042 sq m of flat plate solar collectors facing south at a 45 deg tilt, and 2415 sq m of highly polished aluminum reflectors facing north at a 36 deg tilt. Sixty-three modular solar collectors will be used, each 2.62 m high and 6.30 m wide. The collectors are double glazed with double-weight tempered low-iron glass, and the copper absorber plate is coated with electroplated black chrome. The hot water storage tank and the use of LiBr as an absorption chiller are described. The solar energy system is projected to provide 95% of the total annual energy required for winter heating and 64% of the total annual energy required for summer cooling M L

**A77-48976** **The Lowell Observatory experimental solar heating module** M Scanlon and H Wade In *Sharing the sun Solar technology in the seventies, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976 Volume 3*

Cape Canaveral, Fla., International Solar Energy Society, 1976, p 232-235

The construction of a solar heating module at the Lowell Observatory in Arizona is described. The space to be heated was approximately 300 square feet of floor area in the 42 in reflecting telescope building. The unit was built in two identical, separate modules, one a permanently fixed collector, and the other applicable for experimental purposes. The external structure, based on a triangle, provided the optimum cross section to house both the 6-ton total rock storage and the collector surface, consisting of an array of over 1000 aluminum soft drink cans. Differential temperature sensors and a thermostat device control a damper which determines the air flow configurations SCS

**A77-48977** **Design and construction of a residential solar heating system at Fermilab** J E O'Meara (Fermi National Accelerator Laboratory, Batavia, Ill.) In *Sharing the sun Solar technology in the seventies, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976 Volume 3*

Cape Canaveral, Fla., International Solar Energy Society, 1976, p 236-245

A solar-heating apparatus has been installed for heating a small residence at Fermi National Accelerator Laboratory. This paper describes the design, fabrication, installation, and initial operating experience with this system. Unconventional features of the system include (1) 'fluorescent' glass tubes for collector cover glass, (2) a collapsible low-cost water bag for energy storage, and (3) self draining collector panels to provide freeze protection. The house has a conventional gas-fired forced-hot-air auxiliary heating system. Solar-heated water is fed to a fin coil in the return air duct. Design considerations for sizing this fin coil are discussed. (Author)

**A77-48978** A competitively-priced solar home, using concentrating collectors. J Kusianovich. In Sharing the sun. Solar technology in the seventies, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976. Volume 3.

Cape Canaveral, Fla., International Solar Energy Society, 1976, p 246-260.

This paper describes a 2880 sq ft two-level home completed in Albuquerque in July 1976. It is conventionally constructed and financed and is heated by concentrating solar collectors. These consist of movable reflectors which track the sun and focus its rays on fixed copper pipes, through which water is pumped. They automatically drain and turn away from the sun whenever the pump is off. The hot water is stored in 2-1000 gallon tanks and is delivered to the heated space by a standard hot water baseboard system. Domestic hot water is supplied from the same system. The entire operation is automatically controlled by photo cells and thermostats. The house also receives passive solar gain through south-windows and a built-in greenhouse. The design goal is for 90% solar heating. The overall cost was similar to comparable conventionally heated houses. (Author)

**A77-48980** Solar heating in northern New England. A O Converse (Dartmouth College, Hanover, N.H.). In Sharing the sun. Solar technology in the seventies, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976. Volume 3. Cape Canaveral, Fla., International Solar Energy Society, 1976, p 277-290. 8 refs. NSF-supported research.

The design and performance of several buildings utilizing air, liquid, and solar-heat pump systems are described. Performance measurements include collector efficiency, solar energy collected, and, in some cases, the time-of-day use of electricity. Measured efficiencies are used to compute the long-term expected economic performance. (Author)

**A77-48981** A hybrid solar-assisted heat pump system for residential applications. H T Gordon (Burt, Hill and Associates, Butler, Pa.). In Sharing the sun. Solar technology in the seventies, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976. Volume 3. Cape Canaveral, Fla., International Solar Energy Society, 1976, p 291-320.

A solar-assisted heat pump system was designed for a 2,000 sq ft single family residential dwelling in Buffalo, New York, to make use of the most readily available and broadly applicable solar and HVAC components in regions where electricity is the only available auxiliary fuel. The primary components of the solar/mechanical system include (1) seven hundred square feet single glazed, flat black coated, liquid circulating copper flat-plate solar collectors. Freeze protection is provided by drain-down, (2) two thousand gallon nonpressurized water storage in an insulated concrete storage tank with a special Hypalon Liner, (3) a water circulating, air heating coil for direct solar heating, and (4) an air-to-air split system heat pump for solar-assisted heat pump operation and supplementary

heating. Both units (evaporator and condenser) are placed within the mechanical space with a duct for air intake to the 'outside' unit. The solar system is expected to provide 70% of the annual space heating requirements, and 55% of the annual domestic water heating requirements for the home. The system payback will be under 14 years. (Author)

**A77-48982** Simulation study of solar heat pump systems. V D Karman, T L Freeman, and J W Mitchell (Wisconsin, University, Madison, Wis.). In Sharing the sun. Solar technology in the seventies, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976. Cape Canaveral, Fla., International Solar Energy Society, 1976, p 324-340. 13 refs. Contract No E(11-1)-2588.

The performance of several configurations of solar-augmented heat pump systems are evaluated. These systems include both air and water collection systems with either air-air, water-air, or special hybrid heat pumps which can use both stored energy and ambient air as energy sources. The performance evaluations employ factorial design to determine the effect of the parameters of each individual system. The systems are compared with each other and with conventional solar and conventional heat pump systems. Simulations are done for Madison, Wisconsin, Albuquerque, New Mexico, and Charleston, South Carolina, to investigate climatological effects on solar heat pump performance. The results are used to formulate general guidelines for designing solar-augmented heat pump systems. (Author)

**A77-48983** Solar heating and cooling in a commercial building. E E Adsett, A W Gunn (New Brunswick Electric Power Commission, Fredericton, Canada), and V M Ireton (New Brunswick, University, Fredericton, Canada). In Sharing the sun. Solar technology in the seventies, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976. Volume 3. Cape Canaveral, Fla., International Solar Energy Society, 1976, p 343-355.

The New Brunswick Electric Power Commission has designed a building to demonstrate solar energy exploitation to be built at Shediac, N.B. The building consists of 7000 square feet of office space and 5000 square feet of warehouse space. A solar energy assisted heat pump system is expected to provide approximately 45% of the total office heating requirements using 1260 square feet of collector area and 4000 Imperial Gallons of storage. The solar energy collectors are self draining. Water to air heat pumps are used, and supplementary electric resistance heaters are used in the heat pump source when energy is not available from the water storage. The system also allows air conditioning. The performance of the system is to be monitored, and the experience gained in design and operation is to be made available to the interested public. A separate system to demonstrate domestic water pre heating is also included in the project. (Author)

**A77-48984** An analysis on optimal design of solar heating and cooling system for school. P T Morimura (P T Morimura and Associates, Tokyo, Japan) and Y Ishida (Mitsubishi Heavy Industries, Ltd., Tokyo, Japan). In Sharing the sun. Solar technology in the seventies, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976. Volume 3. Cape Canaveral, Fla., International Solar Energy Society, 1976, p 356-370.

**A77-48985** Solar assisted heat pump air conditioning system. T Dean (Kansas, University, Lawrence, Kan.). In Sharing the sun. Solar technology in the seventies, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976. Volume 3. Cape Canaveral, Fla., International Solar Energy Society, 1976, p 373-377.

The paper presents the design of a solar assist to heat pumps in a year round air conditioning system. The residence in which the system is installed was intentionally designed to be energy conscious. It contains 1850 square feet over a 720 square foot basement,

attached 12' x 20' pit greenhouse, two car garage, and associated porches and storage areas. Solar heated water is used for domestic hot water preheat and for space heating when tank temperature exceeds 95 F. Otherwise, it circulates through the heat pump. A 200 foot water well provides the same function for cooling. Water storage is in a basement located 1500 gallon storage tank and externally located 1500 gallon concrete cistern. A 3.2 kw wind turbine provides additional energy. (Author)

**A77-48986** Operational analysis of a solar optimized heat pump. R. F. Kuharich (Colorado Springs, Dept. of Public Utilities, Colorado Springs, Colo.) In *Sharing the sun: Solar technology in the seventies*, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976. Volume 3. Cape Canaveral, Fla., International Solar Energy Society, 1976, p. 378-386. NSF-supported research.

In 1974, the City of Colorado Springs conducted a solar heating demonstration project. The National Science Foundation through its Research Applied to National Needs Program funded two years of research on the project. This paper will present the operational summary for those two years. During the first year of operation a direct solar heating mode was experimented with as well as an air-to-air heat pump as back up. The second year's operation saw a fluid to air heat pump replace the previous years heating system. The optimized heat pump used the second year of operation proved to be most cost effective. Both years heating systems will be described in detail. Various heat transfer fluids and storage schemes were evaluated during the testing program and their results will be given. (Author)

**A77-48987** Steady-state and transient performance limitations of the ARKLA Solar absorption cooling system. J. S. Rauch (Motorola, Inc., Phoenix, Ariz.) and B. D. Wood (Arizona State University, Tempe, Ariz.) In *Sharing the sun: Solar technology in the seventies*, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976. Volume 3. Cape Canaveral, Fla., International Solar Energy Society, 1976, p. 387-405. 10 refs.

An absorption air conditioner is described and evaluated for its applicability to solar energy systems. The theory of operation is reviewed, and the apparatus used to test the air conditioner is described. Steady-state and transient results are analyzed. An experimental map of the unit's performance over a range of operating conditions obtainable from a flat plate collector and cooling tower is determined for steady-state conditions, and the response to a transient typical of a system is presented. M. L.

**A77-48988** The solar fan - Solar induced draft air conditioning system. R. L. Reid (Cleveland State University, Cleveland, Ohio) and A. F. Bedinger (Tennessee, University, Knoxville, Tenn.) In *Sharing the sun: Solar technology in the seventies*, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976. Volume 4. Cape Canaveral, Fla., International Solar Energy Society, 1976, p. 1-7.

A description is presented of an induced ventilation system which was conceived as a system that might provide most or all of the cooling in the central and northern U.S. and in Canada for a small capital investment and with zero operating cost. In the described solar fan system, an air gap of about six inches is left between the back of the plate of the solar collector and the thermal insulation. With the water supply to the collector turned off, the temperature of the air increases above the environmental temperature level. If an exit and entrance are supplied to the space, the heated air will rise according to the principles of operation of thermosyphon type passive devices. G. R.

**A77-48989** A passive solar heated house - Design and construction. J. Cook and H. Wade (Arizona State University, Tempe, Ariz.) In *Sharing the sun: Solar technology in the seventies*, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976. Volume 4. Cape Canaveral, Fla., International Solar Energy Society, 1976, p. 8-14.

**A77-48990** A non-technical evaluation of four different concrete wall solar collector configurations. B. Anderson, D. Scully, and C. Michal (Total Environmental Action, Inc., Harrisville, N.H.) In *Sharing the sun: Solar technology in the seventies*, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976. Volume 4. Cape Canaveral, Fla., International Solar Energy Society, 1976, p. 15-22.

The design and construction are discussed of four solar houses which use concrete walls with insulating devices on the exterior as the principal solar collector. Two of these projects use 'Beadwall,' one uses a roller-shade-type device made of mylar, and the fourth has a greenhouse as a buffer zone between the concrete wall and the outdoors. Two of these houses have been through a full year of operation. The other two are just completed. (Author)

**A77-48991** Climate based solar house design - Hot and humid Charleston, S.C. D. V. Scully (Total Environmental Action, Inc., Harrisville, N.H.) In *Sharing the sun: Solar technology in the seventies*, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976. Volume 4. Cape Canaveral, Fla., International Solar Energy Society, 1976, p. 23-26.

Described in this paper is a design for a single family dwelling that can be expected to perform well as an environmental control system for hot and humid Charleston, S.C. This performance is a result of a design response to climatic factors such as wind patterns, humidity, solar angles, careful placement of windows and building mass, and the inclusion of an air-type solar heating system, with containerized water storage. **A77-48992** Residential solar heating retrofit in the urban environment. N. Lior, J. A. Lepore, and S. Shore (Pennsylvania, University, Philadelphia, Pa.) In *Sharing the sun: Solar technology in the seventies*, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976. Volume 4. Cape Canaveral, Fla., International Solar Energy Society, 1976, p. 36-52. 8 refs. Research supported by the Pennsylvania Science and Engineering Foundation, U.S. Department of Housing and Urban Development, and University of Pennsylvania.

Residential solar heating retrofit is illustrated by the example of a Philadelphia row home. The implementation of a design philosophy emphasizing a minimal amount of retrofit, an optimal utilization of the existing structure and equipment, high system reliability and easy maintainability is described. The design concepts include a novel energy-collection-optimized method for collector spacing with allowance for some mutual shading, freeze protection by automatic drainage of collector liquid, multitank sensible heat storage in water, and the structural adaptation of the existing roofing system to accommodate and support the solar collectors. B. J.

**A77-48993** A status report on the USAFA solar energy program. J. M. Davis, M. W. Nay, Jr., R. L. Schmiesing, and W. A. Tolbert (U.S. Air Force Academy, Colorado Springs, Colo.) In *Sharing the sun: Solar technology in the seventies*, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976. Volume 4. Cape Canaveral, Fla., International Solar Energy Society, 1976, p. 53-66.

This report describes the initial performance of the first retrofit constructed solar-heated facility in the United States Air Force, the Solar Test House at the United States Air Force Academy. The project involves applying solar energy in a retrofit mode unlike the new construction applications in the private sector. This work is necessary because the Air Force's real property assets are largely fixed. Notable aspects of this project include both roof and ground mounted solar collector arrays, variable collection fluid flow rate, reinforced concrete storage tank, variable slope adjustment for the ground array, retrofit application, on-site weather monitoring capability, and a unique instrumentation and control system. These features have combined to produce a working solar energy laboratory. An extensive system data base has been developed and significant work has been accomplished with regard to developing solar system control techniques. (Author)

**A77-48994** Energy conservation through residential solar retrofit S A Mumma (Arizona State University, Tempe, Ariz ) and J Dzioba (Ohio State University, Columbus, Ohio) In Sharing the sun Solar technology in the seventies, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976 Volume 4. Cape Canaveral, Fla , International Solar Energy Society, 1976, p 67-91

An experimental study was undertaken to evaluate the performance of a low cost air transfer fluid, liquid storage solar water heater It was found that over 35 percent of the annual electric water heating needs could be met with solar energy Further, it was found that up to 35 percent improvement in solar energy collection could be achieved utilizing reflectors Up to 16 percent improvement in energy collection could also be obtained by reducing shading in the collector construction (Author)

**A77-48995** Solar retrofit of a home in Granton, Ontario. D E F Thompson (Saskatchewan Research Council, Saskatoon, Canada) and R K Swartman (Western Ontario, University, London, Canada) In Sharing the sun Solar technology in the seventies, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976 Volume 4 Cape Canaveral, Fla , International Solar Energy Society, 1976, p 92-104

During the fall of 1975, a low cost solar heating system was installed on a house near Granton, Ontario The system was 'home-built' by the owner of the house at a materials cost of \$1,500 00 Tests performed in April, 1976 indicated a collector efficiency ranging from 17 8% to 45 8% with a mean of 33 9% Analyses of meteorological data and fuel consumption determined that the system would deliver 55% of the annual heating requirements in an 'average' year This is the equivalent of 3140 liters of heating oil, for a saving at present fuel costs of \$292 00 annually Some possible areas for system improvement are included (Author)

**A77-48996** Project Sunshower - San Jose State University dormitory retrofit to solar-assisted water heating D W Aitken and D K Rozell (San Jose State University, San Jose, Calif ) In Sharing the sun Solar technology in the seventies, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976 Volume 4 Cape Canaveral, Fla , International Solar Energy Society, 1976, p 105-127 6 refs Research supported by the California State University

Project Sunshower involves the retrofit of three San Jose State University residence halls to solar-assisted hot water heating, with the aid of 3000 sq ft of solar collector surface area oriented in long arrays on the roof of each building The total project with 9000 sq ft of collectors was built with internal funding at a cost of about \$125,000 The paper discusses the location and physical circumstances, presents design criteria and philosophy, defines basic energy and design parameters, and gives mechanical and operational overviews of the project B J

**A77-48997** Solar retrofit applications for public buildings B D Wood (Arizona State University, Tempe, Ariz ) and J F Warnock, Jr (Arizona Solar Energy Research Commission, Phoenix, Ariz ). In Sharing the sun Solar technology in the seventies, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976 Volume 4. Cape Canaveral, Fla , International Solar Energy Society, 1976, p 128-152 8 refs Research sponsored by the Arizona Solar Energy Research Commission and Four Corners Regional Commission

Four buildings in Arizona, a gymnasium, a dormitory, a classroom/office/laboratory building (all three in Flagstaff) and an office building (in Phoenix), all state-owned, were evaluated for solar retrofit applications involving space conditioning and heating service water The basic (building, climatic, solar system and energy) parameters required for a feasibility analysis of solar retrofit applications were established Significant energy savings were found to be possible, but only at a cost benefit which is marginal The payback period for all the systems considered occurred during the second half of the service life of the equipment B J

**A77-48998** A retrofit solar heating system constructed with salvaged and readily available components designed for self-installation by low income families R Clark, W Otwell, D Shaw, and H Wade (Northern Arizona Council of Governments, Flagstaff and Chino Valley, Ariz ) In Sharing the sun Solar technology in the seventies, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976 Volume 4 Cape Canaveral, Fla , International Solar Energy Society, 1976, p 153-156

**A77-48999** System performance of first residential solar installation in Charlottesville, Virginia, U S A - Retrofitted indoor swimming pool W L Gottschalk and H P Austin In Sharing the sun Solar technology in the seventies, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976 Volume 4 Cape Canaveral, Fla , International Solar Energy Society, 1976, p 157-171 8 refs

**A77-49000** Insolation and temperature statistics and their influence on the design of solar heating systems and the electric utility interface W C Melton (Aerospace Corp , Los Angeles, Calif ) In Sharing the sun Solar technology in the seventies, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976, Volume 4 Cape Canaveral, Fla , International Solar Energy Society, 1976, p 172-188 6 refs Research supported by the Electric Power Research Institute

**A77-49001** Simulation study of several solar heating systems with offpeak auxiliary P J Hughes, W A Beckman, and J A Duffie (Wisconsin, University, Madison, Wis ) In Sharing the sun Solar technology in the seventies, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976 Volume 4 Cape Canaveral, Fla , International Solar Energy Society, 1976, p 189-207 9 refs Contract No E(11-1)-2588

Simulation methods have been used to study two basic types of offpeak electric auxiliary solar air heating systems those which separate the storage of auxiliary and solar energy and those which store energy in the same pebble bed. Separate-storage systems are thermally identical to conventional (non-offpeak) solar air heating systems if losses from the auxiliary storage unit are ignored, while combined-storage systems operate at higher temperatures and are simpler from a mechanical point of view Simulation studies, which focused on the effects of system configuration, collector loss coefficients, controls, storage size and collector flow rate on system performance, have shown the superiority of the separate-storage concept The combined-storage systems, however, perform nearly as well, provided that low loss coefficient collectors are used B J

**A77-49002** Solar powered absorption air-conditioning system performance using real and synthetic weather data. D K Anand and R W Allen (Maryland, University, College Park, Md ) In Sharing the sun Solar technology in the seventies, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976 Volume 4 Cape Canaveral, Fla , International Solar Energy Society, 1976, p 208-227 9 refs Contract No E(40-1)-4976

The performance of a solar powered absorption air-conditioning system using real and synthetic weather data is obtained Both air-cooled and water-cooled systems are considered The synthetic data is derived using weather history and represented by a joint probability density matrix and at most six constants The coefficient of performance using real data and synthetic data is compared Long term predictions based on synthetic data are quite good It is concluded that the use of synthetic data allows very inexpensive simulation and yields satisfactory results for design purposes (Author)

**A77-49003** Unified simulation capability for solar heating and cooling system analysis. J E Irby and J M Nash (IBM Corp , Huntsville, Ala ) In Sharing the sun Solar technology in the seventies, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976 Volume 4 Cape Canaveral, Fla , International Solar Energy Society, 1976, p 228-243 7 refs

To support current and projected government programs oriented toward demonstration of solar energy technology, IBM has developed a set of automated analysis tools for preliminary design, detailed performance prediction, and benefits analysis. This multi-level analytical capability consists of six computer programs, some representing the existing state of the art in the solar energy industry (solar energy system simulation and thermal loads prediction) and others being special purpose tools adapted and/or developed by IBM (long-term performance prediction and economic analysis). This paper describes the structure and capability of each and its role in supporting development of the solar energy industry. (Author)

**A77-49004** Performance of a solar heating system utilizing phase-change energy storage. D J Morrison and S I Abdel-Khalik (Wisconsin, University, Madison, Wis.) In Sharing the sun Solar technology in the seventies, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976 Volume 4. Cape Canaveral, Fla., International Solar Energy Society, 1976, p 244-257 11 refs Contract No E(11-1)-2588

A model describing the transient behavior of a phase-change energy storage (PCES) unit is presented. Simulation techniques are used in conjunction with this model to determine the performance of a solar air-heating system utilizing PCES. The effects of storage size and heat transfer characteristics on the system performance are investigated. Optimum ranges of storage sizes are given for systems with paraffin wax and sodium sulfate decahydrate as storage media. Comparison is made between two similar systems with sensible heat and phase-change storage. The variations of the collector efficiency and solar-supplied fraction of the load over the heating season are given for both systems. Actual weather data for the Madison area are used in these simulations. (Author)

**A77-49005** Climatological constraints on the development of solar energy in Canada. J E Hay (British Columbia, University, Vancouver, Canada) In Sharing the sun Solar technology in the seventies, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976 Volume 4. Cape Canaveral, Fla., International Solar Energy Society, 1976, p 258-270 8 refs

This paper recognizes persistency of low radiation inputs and the out-of-phase nature of domestic heat demand and solar energy availability as two climatological constraints on the development of solar energy in Canada. Both problems can be at least partially overcome by the provision of storage and data presented for Vancouver and Winnipeg on the one hand and eight Canadian locations on the other should provide a basis for rational specification of storage requirements. Two types of persistency analyses are undertaken while the requirements for longterm storage are indicated by comparing monthly mean values of available solar energy and domestic heat demand. (Author)

**A77-49006** A design procedure for solar air heating systems. S A Klein, W A Beckman, and J A Duffie (Wisconsin, University, Madison, Wis.) In Sharing the sun Solar technology in the seventies, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976 Volume 4. Cape Canaveral, Fla., International Solar Energy Society, 1976, p 271-279 9 refs

**A77-49007** A simplified method for calculating required solar collector array size for space heating. J D Balcomb and J C Hedstrom (California, University, Los Alamos, N Mex.) In Sharing the sun Solar technology in the seventies, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976 Volume 4. **A77-49008** An averaging technique for predicting the performance of a solar energy collector system. G H Stickford, Jr (Battelle Columbus Laboratories, Columbus, Ohio) In Sharing the sun Solar technology in the seventies, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976 Volume 4

Cape Canaveral, Fla., International Solar Energy Society, 1976, p 295-315 6 refs

An averaging technique, based on an approach of Hottel and Whillier (1955), is described which simplifies the task of predicting the performance of a solar energy collector system. The long term average daily energy gain of a collector system is determined, and, by assuming that the mid-month day is representative of the entire month, only 12 calculations are required to determine the yearly performance of the system. The collector parameters required are the heat removal efficiency factor, the product of transmissivity-absorptivity evaluated at 50 deg angle of incidence, the monthly average absorber plate temperature, the latitude and collector tilt angle, and the collector area. The meteorological data required are the monthly average ambient temperature, the monthly degree-day data, the monthly atmospheric transmission factor, and the solar flux incident on the collector. The technique has been applied to the prediction of the performance of the MIT Solar House IV. B J

**A77-49010** Minimum cost sizing of solar heating systems. J C Ward (Colorado State University, Fort Collins, Colo.). In: Sharing the sun Solar technology in the seventies, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976 Volume 4. Cape Canaveral, Fla., International Solar Energy Society, 1976, p 336-346 Research supported by the Economic Development Administration and Colorado State University

The characteristics of solar heating systems as they would function in 11 cities scattered across the USA were examined, and a correlation was found between the fraction of the annual heating load furnished by solar energy and a dimensionless ratio, (solar collector area times the January solar radiation)/(the January heating load of the building). A 'typical' liquid heating solar collector was used, and it was assumed that there was no heat exchanger between the solar collector and the hot water heat storage tank. Estimates of the monthly fraction of the heating load as a function of the collector characteristics and area, heating load, and local climate, were obtained from a paper by Klein, Beckman, and Duffie (1975). M.L.

**A77-49012** A structural design process for solar energy systems. V H Johnson, A J Kemp, and R B Lollar (IBM Corp., Huntsville, Ala.) In Sharing the sun Solar technology in the seventies, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976 Volume 4. Cape Canaveral, Fla., International Solar Energy Society, 1976, p 360-374

An approach to solar energy system design is described which involves detailed computer simulation and mathematical optimization constrained by practical considerations and physical subsystem characteristics. A second activity involves the nuts and bolts tasks associated with transforming the analytically optimum paper design into an installation which will perform reliably over a reasonable lifetime. The technical approach has been divided into three major elements: subsystem evaluation, cost/performance trade studies and system design. The design of a liquid hot water and space heating system for a typical residence in the Southeast United States is considered and the use of such a design process for systems in the Tennessee Valley Area is discussed. B J

**A77-49014** Site Data Collection System for solar energy applications. C K Luttrell (Teledyne Brown Engineering, Huntsville, Ala.) In Sharing the sun Solar technology in the seventies, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976 Volume 4. Cape Canaveral, Fla., International Solar Energy Society, 1976, p 384-402. Research supported by the Teledyne Brown Engineering.

A cost-effective Site Data Collection System has been developed for evaluating solar heating and cooling systems. It is adaptable to large or small acquisition tasks, can store data for extended periods, and can be set up for local removal of data via cassette tape or remote polling via telephone link, allowing immediate site monitoring. Collection of solar energy has been achieved by combining environmental transducer units with interconnection cables and data acquisition units. A microprocessor performs the system timing and

control functions. The system allows the user to plan sample rates and to select the number of channels to monitor, data retrieval methods, and conversion time on input data and data compression.

B J

**A77-49015** Microcomputer processor for monitoring of solar heated buildings. K C Forseth, I H Thomae, and A O Converse (Dartmouth College, Hanover, N H). In Sharing the sun Solar technology in the seventies, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976. Volume 4.

Cape Canaveral, Fla., International Solar Energy Society, 1976, p 403-406.

A multi-channel monitoring system, utilizing a programmable microcomputer, has been developed in which preliminary data reduction is performed by the recording instrument. Accumulated performance measures can be printed hourly or daily, or, through the use of an external data set, the instrument may be polled by telephone to retrieve the data. The parts to build the 8-channel prototype cost \$900. In lots of 100 these could presently be purchased for \$500, we therefore estimate that the monitor could be manufactured and sold for \$2500. (Author)

**A77-49016** Cost effective solar heating of houses with seasonal storage of energy. R W Besant (Saskatchewan, University, Saskatoon, Canada) and C B Winn (Colorado State University, Solar Environmental Engineering Co., Inc., Fort Collins, Colo.). In Sharing the sun Solar technology in the seventies, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976. Volume 4.

Cape Canaveral, Fla., International Solar Energy Society, 1976, p 409-424. 13 refs.

A feasibility study of solar heating with seasonal storage of energy has been carried out, with consideration of such technologies as space and service hot water heating using flat plate, vacuum tube array and tracking and focusing collectors. Cost and size comparisons are made for six North American cities in a computer simulation based on the average hourly monthly output of each collector. It was found that oversizing the collector area resulted in a decreased size of storage volume for hot water, especially for high performance collectors. It is suggested that moderate sizes of solar components would be required in most parts of North America, and that costs of such systems would be competitive with present heating costs for some fuels in some locations when the cost of an auxiliary heating system and chimney are removed from present costs. B J

**A77-49017** Solar thermal system requirements. D E Anderson (Sheldahl, Inc., Northfield, Minn.). In Sharing the sun Solar technology in the seventies, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976. Volume 5.

Cape Canaveral, Fla., International Solar Energy Society, 1976, p 1-8.

The collection and utilization of solar thermal energy for electrical power production, industrial process heat, and total energy systems is examined with regard to collection efficiency and system cost. Depending upon such factors as use temperature, siting requirements, back-up energy sources, and cooling requirements, a variety of collection systems may have 'best effectiveness' for given applications. Systems ranging from low temperature (around 100 C) to high temperature (around 500 C) can be all fabricated, installed, and maintained with state-of-the-art technology, wide-scale use will depend upon selecting the right system and/or the right application. (Author)

**A77-49018** Technical and economic feasibility of Ocean Thermal Energy Conversion. G L Dugger, E J Francis, and W H Avery (Johns Hopkins University, Laurel, Md.). In Sharing the sun Solar technology in the seventies, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976. Volume 5.

Cape Canaveral, Fla., International Solar Energy Society, 1976, p 9-45. 46 refs. Research supported by the U.S. Maritime Administration and ERDA.

Ocean Thermal Energy Conversion (OTEC) plants will employ the temperature difference between the solar heated surface layer of

a tropical ocean (24 to 28 C) and the water at 500 to 1200 m depth (4 to 7 C) as the source and sink for a Rankine cycle system to generate electric power. The first commercial plants could be deployed in the mid-1980s, and we believe they will be competitive then with fossil fuel and nuclear energy sources for selected applications. Ammonia (for fertilizers) is a particularly attractive product, because 95% of the ammonia produced in the U.S. is now made from natural gas, our scarcest resource. Direct delivery of electric power to shore may also be competitive for, e.g., the southeastern United States. In the 1990s, delivery of liquid hydrogen and many other products should become attractive. Various OTEC plant-ship concepts, their economics, onboard production plants, and some of the environmental considerations are discussed. (Author)

**A77-49019** Survey of the applications of solar thermal energy to industrial process heat. M D Fraser (InterTechnology Corp., Warrenton, Va.). In Sharing the sun Solar technology in the seventies, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976. Volume 5. Cape Canaveral, Fla., International Solar Energy Society, 1976, p 46-57. Contract No. E(11-1)-2829.

The considered survey constitutes an initial project which is to provide data useful to ERDA to determine the scope, extent, and direction of future work related to the utilization of solar thermal energy for industrial processing applications. The first task is to obtain information concerning the use of process heat by industry in its production processes. The overall objective of the second task is to identify the characteristics of various solar thermal energy systems with regard to their ability to provide the process heat. To analyze the economics of solar thermal energy employed in industrial applications, a procedure has been developed which will be used to calculate the cost of solar energy for the different systems as a function of temperature and solar region. G R

**A77-49020** Solar energy for process heat. R Reimels (Brown and Root, Inc., Houston, Tex.) and J R Howell (Houston, University, Houston, Tex.). In Sharing the sun Solar technology in the seventies, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976. Volume 5. Cape Canaveral, Fla., International Solar Energy Society, 1976, p 58-76.

The use of solar systems to supplement process heat loads is discussed. Direct and indirect solar systems are considered, and the computer analyses of thermal performance, a storage model, and a collector model are described. Some output data are provided. The economic feasibility of solar systems is examined, with attention to industrial requirements. M L

**A77-49021** A solar/Stirling total energy system. R L Pons (Ford Aerospace and Communication Corp., Aeronutronic Div., Newport Beach, Calif.) and R J Fox (Walt Disney Productions, WED Enterprises Div., Glendale, Calif.). In Sharing the sun Solar technology in the seventies, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976. Volume 5.

Cape Canaveral, Fla., International Solar Energy Society, 1976, p 77-91. 12 refs.

A conceptual design of a solar-powered Stirling engine-driven total energy system (TES) is presented. Analysis results are given for a demonstration system which would supply the total energy needs of an advanced concept multi-unit residential complex. The concept also has application to commercial buildings, schools, hospitals, and shopping centers. The system is designed to make maximum use of Stirling automotive technology under current development. Preliminary economic analysis, based on large-scale production of components, indicates an equivalent electrical cost for the proposed complex on the order of 50 mils/KWh. (Author)

**A77-49022** Conceptual design of an open cycle gas turbine solar central receiver system. E Fourakis and P D. Mitchell (Energy Resources Center, Minneapolis, Minn.). In Sharing the sun Solar technology in the seventies, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976. Volume 5.

Cape Canaveral, Fla., International Solar Energy Society, 1976, p 92-98.

In the conceptual design of a high-temperature solar electric plant, two mathematical models and associated computer software have been developed and extensively used. The solar central receiver model analyzes the performance of various combinations of collector field and central receiver geometries in terms of gross power received and power flux maps on the receiver walls. The software is a Monte Carlo ray-trace. The heat exchanger and cavity analysis model evaluates the microscopic performance of the heat transfer surfaces and uses the results to evaluate the macroscopic performance of the receiver cavity as a whole. (Author)

**A77-49023** Smith multimodule solar-electric plant. O J M Smith (California, University, Berkeley, Calif.) In *Sharing the sun: Solar technology in the seventies*, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976. Volume 5. Cape Canaveral, Fla., International Solar Energy Society, 1976, p. 99-116.

A practical solar-thermal-electric power plant can be built at a reasonable cost with available materials and conventional engineering design techniques. Fields of steerable mirrors concentrate the reflected sunlight on hot receptors behind heat-conserving windows on short towers. The absorbed heat from the hot receptors is carried by heat exchange fluids through pipes to a central station power plant containing heat exchangers to preheat and boil water and to superheat steam, and a conventional turbine and electrical generator. A 100-megawatt power plant would be supplied from 1100 towers of 35 meters height, each tower receptor illuminated by a hexagonal field of 50 meters by 48 meters. Each field has 312 mirrors of 2 square meters surface each. The capital cost in dollars per megawatt-hour of annual production has been reduced by unique heliostat field geometry, mirror construction, high transmission window, high absorption cavity, and optimum utilization of available heat at different temperatures in the thermodynamic cycle. (Author)

**A77-49024** Shallow solar ponds for industrial process heat - The ERDA-Sohio project. W C Dickinson, A F Clark, and A Iantuono (California, University, Livermore, Calif.) In *Sharing the sun: Solar technology in the seventies*, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976. Volume 5. Cape Canaveral, Fla., International Solar Energy Society, 1976, p. 117-142. 7 refs. Contract No. W-7405-eng-48.

Shallow solar ponds to supply cost-competitive solar heated water for industrial use have been developed. A prototype system has been built and put into operation at the site of a new uranium mine and milling complex near Grants, New Mexico. When operational, a projected full-size system is expected to furnish approximately half of the 10 to the fifth GJ annual site process heat requirement. A description of the physical features of shallow solar ponds is presented along with a method for analyzing pond performance. An economic analysis of the projected solar system is provided. (Author)

**A77-49025** A generalized numerical model for predicting energy transfers and performance of large solar ponds. B W Davis (Northern Arizona University, Flagstaff, Ariz.), J A Day, and A Iantuono (California, University, Livermore, Calif.) In *Sharing the sun: Solar technology in the seventies*, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976. Volume 5. Cape Canaveral, Fla., International Solar Energy Society, 1976, p. 143-168. 5 refs.

A highly generalized numerical model is being developed for predicting energy transfers and performance characteristics of large solar ponds. The code will be used to optimize the design and operation of a large solar pond system which is expected to provide a large part of the 400,000 gallons of 140 F water used per day at a uranium milling facility in New Mexico. The code predicts that two inches of glass foam insulation will reduce the energy losses by more than 20% over the 'no-insulation' condition. The code provides information about the energy delivered in response to a myriad of variations in the fill/empty cycle, and also provides information on several other subjects, which are described. A brief discussion of extensions of the code is also presented. (Author)

**A77-49026** Experience with a prototype solar pond for space heating. C E Nielsen (Ohio State University, Columbus, Ohio). In *Sharing the sun: Solar technology in the seventies*, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976. Volume 5. Cape Canaveral, Fla., International Solar Energy Society, 1976, p. 169-182. Research supported by the Ohio State University.

A solar pond of 2.5 m depth and 200 sq m area has been operated since Aug 1975. It was conceived as an economic prototype, and commercial construction cost is estimated at \$7500, heat calculated available for winter use is 50,000 kW-hr thermal. To determine performance, the distributions of temperature in pond and earth and of salinity have been recorded. Behavior of surface and internal convection layers has been studied, and methods for eliminating them have been explored. Heating of sloping black walls may be troublesome but can be eliminated by design modification. Algae growth and contamination by leaves have occurred but appear manageable. Because of the late start, no heat was extracted last winter. Minimum pond temperature under ice and snow cover was 28 C in Feb 1976, in June it reached 62 C. On the whole, performance to date is encouraging. (Author)

**A77-49027** Salt requirement and stability of solar ponds. C E Nielsen (Ohio State University, Columbus, Ohio) and A Rabi (Argonne National Laboratory, Argonne, Ill.). In *Sharing the sun: Solar technology in the seventies*, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976. Volume 5. Cape Canaveral, Fla., International Solar Energy Society, 1976, p. 183-187. 12 refs.

The cost involved in the establishment of solar-pond systems for the storage of solar energy is largely determined by the cost of the salt. The stability conditions for the solar pond are considered with the objective to minimize the salt requirements. A framework is presented for analyzing the stability of the boundary between a convective and a nonconvective layer of a solar pond. Attention is also given to approaches for preserving the required salinity gradient against diffusion. G R

**A77-49028** Solar pond stability experiments. J P. Leshuk, R J Zaworski (Oregon State University, Corvallis, Ore.), D L Styris, and O K Harling (Battelle Pacific Northwest Laboratories, Richland, Wash.). In *Sharing the sun: Solar technology in the seventies*, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976. Volume 5. Cape Canaveral, Fla., International Solar Energy Society, 1976, p. 188-202. 12 refs. Contract No. AT(45-1)-1830.

Nonconvecting salt pond solar collector/storage systems are studied with attention to the long term stability of salinity gradients. The results of a year long experimental investigation are reported with conclusions drawn from partial data reduction. Despite limitations of model systems, which are discussed, favorable observations about the stability of these thermohaline systems were obtained. A maximum bottom temperature of 76 C and stable temperature gradients ranging from 150 - 300 C/meter were detected. Slow top and bottom mixing layer growth was the only failure mode noted despite attempts to introduce instabilities at intermediate levels. It is thought that normal energy extraction and evaporation make-up methods might provide a stabilizing influence. \* M L

**A77-49029** Solar industrial steam. A F. Clark (California, University, Livermore, Calif.) and M. F. Meriam (California, University, Livermore and Berkeley, Calif.). In *Sharing the sun: Solar technology in the seventies*, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976. Volume 5. Cape Canaveral, Fla., International Solar Energy Society, 1976, p. 203-209. 6 refs. Contract No. W-7405-eng-48.

Advantages of solar heating for industrial uses are considered. Economics of scale can make industrial systems cost effective, and the larger amounts of heat collectable in the summer can be used. Since the energy content of steam is due mostly to heat of vaporization, it is recommended that a solar energy assist to process steam should try to make steam rather than just preheat hot water. A

preferred scheme for making steam involves an inexpensive low concentration reflector in the form of a cylinder of inflated plastic film, transparent on top and reflecting on the bottom, a black pipe containing water (and steam) is placed at the focal line. The produced steam can be compressed. A possible 24-hr supply system is considered, and some parameters of a possible solar steam system are indicated M L

**A77-49030 Study of a solar assisted diffusion separation process for isotopic mixtures** L E Ita (Nevada, University, Las Vegas, Nev.) In *Sharing the sun Solar technology in the seventies, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976 Volume 5*, Cape Canaveral, Fla., International Solar Energy Society, 1976, p 220-231 5 refs

The paper discusses the possibility of utilizing direct solar radiation to create the required temperature gradient for a planar thermal diffusion separating column. The resulting temperature difference from thermal insolation is expressed as a function of the column characteristic Biot number. The separation factor is described for (1) a single cell with no cell circulation (resulting in a low separation factor and a high yield rate), and (2) a system of cells with cell circulation (resulting in three performance indicators: the specific static mass, specific energy, and specific area). An equal stage separation model is described with regard to factors influencing the specific area, and an example of intermediate gaseous uranium h-fluoride production is presented S C S

**A77-49031 Development of lightweight compound parabolic concentrators for solar thermal electric and process heat applications** J Allen, N Levitz, A Rabl, K Reed, W. Schertz, and R Winston (Argonne National Laboratory, Argonne, Ill.) In *Sharing the sun Solar technology in the seventies, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976 Volume 5*, Cape Canaveral, Fla., International Solar Energy Society, 1976, p. 232-241 7 refs ERDA-supported research

The design and construction of a lightweight collector panel that uses the Compound Parabolic Concentrator (CPC) to achieve maximal concentration with minimal tracking requirements is described. The primary goal of the effort has been the development of methods of constructing the units with low cost materials that still allow high temperature (120-230 C) operation. The use of thermoformed plastics for both the container box and the reflector substrate has been investigated for use in combination with an evacuated glass tube around the absorber plate. The predicted performance of the collector has been calculated, and the problem of keeping the reflectors cool has been addressed. Preliminary results on the reflector tests are presented. (Author)

**A77-49032 Solar thermal electric power systems - Comparison of line focus collectors** W S Duff and W W Shaner (Colorado State University, Fort Collins, Colo.) In *Sharing the sun Solar technology in the seventies, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976 Volume 5*, Cape Canaveral, Fla., International Solar Energy Society, 1976, p 244-271 15 refs

Three different line focus collectors, the parabolic trough, the circular array of fixed slats with a movable absorber, and the linear array of movable curved slats with a fixed absorber, are evaluated using minimum cost per kilowatt hour of electricity generated as the measure of performance. The minimum cost of electricity is found using a sequential optimization approach that considers variations in rim angle, reflectance, aperture width, length, orientation, tracking, contour error, slat width, slat curvature, tangent slat angle, slope, design, installation methods, materials, fabrication methods, absorptance, emittance, cover transmittance, field shape, layout, pipe sizes, insulation thicknesses and turbine-generator-cooling tower efficiencies and designs. This approach provides a uniform treatment of both cost and performance for the solar thermal electric power system. This uniform treatment of solar thermal electric power systems for all collector types insures that valid comparisons can be made. (Author)

**A77-49033 Turntable solar arrays** C J Swet (ERDA, Washington, D C.) In *Sharing the sun Solar technology in the seventies, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976 Volume 5*, Cape Canaveral, Fla., International Solar Energy Society, 1976, p 274-290 5 refs

A method of assembling and orienting extremely compact arrays of linear concentrators is described, in which the entire array is rotated as a unit in turntable fashion to follow the sun. The performance of such arrays is examined parametrically in terms of direct energy interception per unit area, as a function of geometry, geographic latitude, time of day, and season of year, and is shown to exceed that of arrays of individually oriented linear collectors that rotate about North-South polar axes. An adaptation based on the use of tilted Fresnel refractors is described, which enables the collection of diffuse sunlight while concentrating the direct component. The feasibility and utility of this adaptation are preliminarily assessed. Applications of turntable arrays to irrigation pumping, electric power generation, and total energy systems are depicted. (Author)

**A77-49034 \* Technical feasibility of a modular dish solar electric system** B P Gupta (Honeywell Energy Resources Center, Minneapolis, Minn.) In *Sharing the sun Solar technology in the seventies, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976 Volume 5*, Cape Canaveral, Fla., International Solar Energy Society, 1976, p 291-309 Contract No NAS3-19740

The paper presents the technical feasibility of generating electricity by using a gas turbine in conjunction with a paraboloid of revolution (dish) solar concentrator. A conceptual design of a dish concentrator is obtained by parametrically examining the significant optical parameters. The optical performance analysis was conducted using a Monte Carlo ray-trace simulation program. The performance of four candidate thermodynamic cycles utilizing two working fluids was analyzed, the cycles were the regenerative and nonregenerative Brayton cycles of both open and closed type. Air and helium were the working fluids for the open and closed type respectively. Heat transfer from the solar radiation to the gas flowing in metal tubes at the receiver was also analyzed. A paraboloid of revolution dish with a cavity receiver using an open air regenerative Brayton cycle turbine emerged as a technically feasible concept in the power range from 30 to 100 KWth per module. (Author)

**A77-49035 Fermi function model absorption profile for solar-thermal conversion** D E Soule, J H Schnitzmeyer, and W R McKie (Western Illinois University, Macomb, Ill.) In *Sharing the sun Solar technology in the seventies, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976 Volume 5*, Cape Canaveral, Fla., International Solar Energy Society, 1976, p. 310-322 10 refs Research supported by the Western Illinois University and Argonne National Laboratory.

A parametrized Fermi function model is introduced to fit the spectral absorptance profiles of typical spectrally selective absorbing layers over the wavelength range from 0.3 to 40 microns. The resulting temperature dependence of spectral and thermodynamic solar-thermal conversion efficiencies for a focused concentrator system are calculated. Comparisons made between spectrally selective and blackbody absorbers over the concentration ratio range from 1X to 10,000X showed spectrally selective absorbers to be advantageous usually up to at least 100X (about 500-800 C), with the assumption that the absorbing surface is thermally durable over the required temperature range. With existing optical data, the effect of high-temperature spectral absorptance is also taken into account. The relative merits of the parametrized model versus the usual spectral absorptance/emittance ratio are discussed in the light of potential solid-state spectral absorptance profile tailoring. (Author)

**A77-49036 A central receiver solar system applicable to central power stations.** R. L. Gervais (McDonnell Douglas Astronautics Co., Huntington Beach, Calif.), J. M. Friefeld (Rockwell International Corp., Rocketdyne Div., Canoga Park, Calif.), and A. W. McKenzie (Stearns-Roger, Inc., Denver, Colo.) In *Sharing the sun Solar technology in the seventies, Proceedings of the Joint*

Conference, Winnipeg, Canada, August 15-20, 1976. Volume 5  
Cape Canaveral, Fla., International Solar Energy  
Society, 1976, p. 325-335.

This paper presents an overview of a central receiver solar thermal electric system. The design is distinct in that it utilizes (1) first-surface mirrored heliostats, (2) an external, single pass-to-superheat receiver, and (3) a sensible heat, thermocline type thermal storage. A 100-MWe commercial power plant, designed for integration into a utility network, is described. A 10-MWe pilot plant whose purpose is to establish technical feasibility and provide an indication of system economics for the commercial system is then given focus. The solar-indigenous subsystems of the 10-MWe pilot plant, i.e., the collector, receiver, and thermal storage are also addressed in some detail. (Author)

**A77-49037** Central receiver solar thermal power F A Blake (Martin Marietta Aerospace, Denver, Colo.). In Sharing the sun Solar technology in the seventies, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976. Volume 5  
Cape Canaveral, Fla., International Solar Energy Society, 1976, p. 336-354. Contract No E(04-3)-1110

The planning of a 10 MWe solar power plant intended as a pilot plant for a 100 MWe project is discussed. A schematic of the pilot plant is provided, and its baseline configuration with respect to the 100 MWe plant is explained. The planned development of cavity receivers is described with attention to features of a 1 MWth cavity receiver steam generator. Two planned experiments, the thermal storage subsystem research experiment and the concentrating heliostat research experiment, are described. The electric power generation subsystem is examined. A preliminary economic summary and a typical day performance profile are provided. M L

**A77-49038** Solar flux density distributions on central tower receivers M Riaz and T Gurr (Minnesota, University, Minneapolis, Minn.). In Sharing the sun Solar technology in the seventies, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976. Volume 5  
Cape Canaveral, Fla., International Solar Energy Society, 1976, p. 356-373. 5 refs

An analytical formulation of the solar flux density distributions produced on the surface of a central tower receiver by large mirror fields is developed. This formulation accounts for dispersion, shading, and screening effects of mirrors, and for degradation of insolation levels. The case of symmetrical geometries involving circular mirror fields and vertical cylindrical receivers is analyzed. A general method of calculation yields closed-form solutions for the concentration ratios in terms of normalized parameters describing the mirror field configuration, the receiver dimensions, the insolation levels, the mirror characteristics, and the time of the day. Aiming strategies of mirror focusing and mirror field asymmetries which induce flux gradients around the receiver are examined. The methodology can be applied to many other geometries considered for receivers in solar power tower systems. M L

**A77-49039** Collector field design for a central receiver solar thermal power plant C. R. Easton, J. E. Raetz, and L. L. Vant-Hull (McDonnell Douglas Astronautics Co., Huntington Beach, Calif., Houston, University, Houston, Tex.). In Sharing the sun Solar technology in the seventies, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976. Volume 5.  
Cape Canaveral, Fla., International Solar Energy Society, 1976, p. 374-384.

The collector field design of a central receiver solar thermal power plant is described, and cost estimates of the system are presented. The collector subsystem consists of an array of tracking heliostats and field controllers, concentrating the sun's light to the top of a tower located within the array. Front-surface-silvered 6.34 mm float glass with an acrylic coating is used for the reflecting surface, supported against wind and gravity loads. The drive unit, incorporating an elevation/azimuth gimbal mount, and the heliostat pedestal structure are discussed. Control sensors include beam sensors for normal tracking and position potentiometers for mea-

suring the angular positions of the gimbal axes. The field controller is used as a communication link between the master control and heliostat, and provides the heliostat closed-loop control, drive-motor and control-sensor power, and fault detection. A preliminary cost evaluation for collector and receiver construction and installation is included. S.C.S.

**A77-49040** Heliostat field design for the ERDA 5 Megawatt Solar Thermal Test Facility. E. M. Fourakis, K. L. Curtner, and P. D. Mitchell (Honeywell Energy Resources Center, Minneapolis, Minn.). In Sharing the sun Solar technology in the seventies, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976. Volume 5.  
Cape Canaveral, Fla., International Solar Energy Society, 1976, p. 385-391.

The working heliostat field for the ERDA 5 Megawatt Solar Thermal Test Facility was designed to meet the solar thermal power requirements for testing 4 different receiver subsystem research experiments. Requirements for the field were specified in terms of yearly solar thermal energy available from the heliostats and instantaneous power levels delivered by the heliostat field to the experiments. A ray-trace simulation model of the subsystem research experiment receivers and heliostat field was the principal tool used in this conceptual design. Field deployment, focusing strategy, number of heliostats and total mirror area required to accomplish the test objectives of the facility were established. (Author)

**A77-49041** Economic aspects of Ocean Thermal Energy Conversion F. E. Naef (Lockheed Missiles and Space Co., Inc., Washington, D.C.). In Sharing the sun Solar technology in the seventies, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976. Volume 5.  
Cape Canaveral, Fla., International Solar Energy Society, 1976, p. 392-411. 7 refs

The results of several studies indicate that solar energy collected by the surface layers of the ocean can be converted to electricity using contemporary technology, and with design and fabrication improvements, can be made economically competitive with fossil and nuclear fueled plants. OTEC technology is reviewed and economic issues are identified and discussed. Because the plant is modular and operates in the marine environment, major components can be manufactured in existing shipyards and can be operated by established marine contractors and maritime labor. The process of large scale implementation is investigated by conceptualizing a Technology Delivery System (TDS) and examining the impact of various design features and government incentives. (Author)

**A77-49042** Preliminary research on Ocean Energy Industrial Complexes. C. D. Hornburg, B. Lindal, and N. El-Ramly (DSS Engineers, Inc., Ft. Lauderdale, Fla.). In Sharing the sun Solar technology in the seventies, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976. Volume 5.  
Cape Canaveral, Fla., International Solar Energy Society, 1976, p. 412-435. ERDA-supported research.

Results of a one year study on the feasibility of producing energy intensive products at ocean sites using electricity generated from Ocean Thermal Energy Conversion (OTEC) plants are presented. Analysis of production methods and other data on 62 major products lead to selecting 23 of these for further study. Production was grouped into five separate, possible complexes. Further market and transportation studies showed that production of products in a sea chemicals complex and an organic chemicals and plastics complex had the highest economic potential. Detailed designs of these two complexes are presented. The three potential sites were selected for these OEICs. An environmental assessment revealed that these complexes would have no adverse environmental impact. The selected products can be produced at ocean sites competitively with production at similar land-based complexes. Return on investment will be between 13% and 18% depending on actual power costs and details of the final designs. (Author)

**A77-49046** Design of low-cost aluminum heat exchangers for OTEC plant-ships. H. L. Olsen, P. P. Pandolfini, R. W. Blevins, G. L. Dugger, and W. H. Avery (Johns Hopkins University, Laurel, Md.) In Sharing the sun Solar technology in the seventies, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976, Volume 5. Cape Canaveral, Fla., International Solar Energy Society, 1976, p. 485-506 24 refs ERDA-supported research

Successful commercial implementation of ocean thermal energy conversion (OTEC) plant-ships will require a capital cost competitive with land-based plants. The most expensive components of an OTEC system are the evaporators (heated by warm surface water), the condensers (cooled by water from 700-1000 m depth), and the floating ocean platform. To minimize these costs, simple two-phase-flow heat exchangers made of large-diameter aluminum tubes (ammonia inside, sea water outside) have been designed for integration in a simple barge-type reinforced concrete hull. Each 2.5-MWe (net) evaporator or condenser module has 132 tubes approximately 700 ft long, folded to 27 horizontal passes each, 6 of these tubes are 'nested' in a vertical plane in each of 22 'elements'. The estimated costs for the heat exchangers are reported. (Author)

**A77-49047** Sensitivity analysis for OTEC propane and mixture cycles. C. A. Lawson, K. Z. Iqbal, L. W. Fish, and K. E. Starling (Oklahoma, University, Norman, Okla.) In Sharing the sun Solar technology in the seventies, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976, Volume 5.

Cape Canaveral, Fla., International Solar Energy Society, 1976, p. 507-521 Contract No. E(40 1)-4944

The results of sensitivity analysis calculations are presented for OTEC (Ocean Thermal Energy Conversion) cycles using propane and propane - n-butane mixtures as working fluids. Parameter studies in the sensitivity analysis include heat exchanger LMTD's (log mean temperature differences), sea water velocities in heat exchanger tubes, warm sea water temperature rise and cold sea water temperature drop in the heat exchangers, and the cold sea water pipe length. In addition, mixture composition (mole fraction n-butane) for the propane - n-butane system was treated as a parameter. These calculations show that with present state of the art heat exchanger technology there are virtually no economic tradeoffs because of the dominant costs of the heat exchangers. It was observed that because mixtures offer an increased economic advantage over pure working fluids as the temperature rise of the cold sea water is increased, mixtures as working fluids should become more attractive as heat exchanger costs are reduced. (Author)

**A77-49048** Gulf Stream OTEC resource potential and environmental impact assessment overview. H. P. Harrenstien and W. R. McCluney (Florida Solar Energy Center, Cape Canaveral, Fla.). In Sharing the sun Solar technology in the seventies; Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976, Volume 5. Cape Canaveral, Fla., International Solar Energy Society, 1976, p. 522-534, 6 refs.

The basic features of the Ocean Thermal Energy Conversion (OTEC) project are described with regard to environmental impact and the potential of Gulf Stream resources for the construction of an OTEC plant. Categories of environmental considerations are outlined for both the plant itself and the related land-based construction and support facilities with the alteration of the near-surface portion of the thermocline identified as the most significant problem. Climatological effects of a depressed sea surface temperature is discussed in terms of both regional and global effects. The Gulf Stream resources are presented along with a basic analytical model and related calculations. S. C. S.

**A77-49049** A comparison of the economics of nuclear and solar power. C. Zener (Carnegie-Mellon University, Pittsburgh, Pa.) In Sharing the sun Solar technology in the seventies, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976, Volume 5. Cape Canaveral, Fla., International Solar Energy Society, 1976, p. 535-548 5 refs.

This paper compares the estimated capital costs per net power capacity for nuclear and for ocean thermal energy conversion (OTEC) plants ordered today for delivery in the mid-1980s. The estimate for nuclear plants takes into consideration the 24% annual increase in estimated costs since 1967, the historical factor of two of the actual cost over the estimated cost, and the low 56% average capacity factor for large nuclear plants, versus the planned for capacity factor of 80%. The estimate for OTEC plants starts from estimates made by industry using only state-of-the-art components and introducing anticipated improvements in the performance of heat-exchangers. The estimates obtained in this manner give about \$3000/kW for nuclear and approximately \$1000/kW for OTEC generating capacity with 80% capacity factor. (Author)

**A77-49050** Solar cells for terrestrial applications. H. J. Hovel (IBM Corp., Yorktown Heights, N.Y.) In Sharing the sun Solar technology in the seventies, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976, Volume 6.

Cape Canaveral, Fla., International Solar Energy Society, 1976, p. 1-21 87 refs.

The four main types of solar cells are described in detail, including silicon, cadmium sulfide-copper sulfide, concentrator and thin film cells. Energy band diagrams are presented for some of the cells and attention is given to energy conversion efficiencies. The emphasis is placed on terrestrial rather than space applications. B. J.

**A77-49051** EFG growth of silicon ribbon for solar cells. K. V. Ravi and A. I. Mlavsky (Mobil Tyco Solar Energy Corp., Waltham, Mass.) In Sharing the sun Solar technology in the seventies, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976, Volume 6. Cape Canaveral, Fla., International Solar Energy Society, 1976, p. 23-33 14 refs.

The paper reviews the status of the edge-defined, film-fed growth (EFG) process for producing ribbon-shaped crystals of silicon for solar cell applications. Attention is given to equipment, cost and ribbon-quality considerations along with crystal growth characteristics. Solar cells in two sizes have been fabricated from the silicon ribbons: 1 cm x 2 cm and 1 in x 4 in. Cell efficiencies are in the 7-12% (AM1) range, with the larger area cells exhibiting the lower efficiencies. B. J.

**A77-49052 \*** Development of low-cost silicon crystal growth techniques for terrestrial photovoltaic solar energy conversion. J. A. Zoutendyk (California Institute of Technology, Jet Propulsion Laboratory, Pasadena, Calif.) In Sharing the sun Solar technology in the seventies, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976, Volume 6.

Cape Canaveral, Fla., International Solar Energy Society, 1976, p. 34-47 22 refs.

Because of the growing need for new sources of electrical energy, photovoltaic solar energy conversion is being developed. Photovoltaic devices are now being produced mainly from silicon wafers obtained from the slicing and polishing of cylindrically shaped single crystal ingots. Inherently high-cost processes now being used must either be eliminated or modified to provide low-cost crystalline silicon. Basic to this pursuit is the development of new or modified methods of crystal growth and, if necessary, crystal cutting. If silicon could be grown in a form requiring no cutting, a significant cost saving would potentially be realized. Therefore, several techniques for growth in the form of ribbons or sheets are being explored. In addition, novel techniques for low-cost ingot growth and cutting are under investigation. (Author)

**A77-49053 \*** Design considerations of solar arrays for terrestrial applications. R. G. Ross, Jr. (California Institute of Technology, Jet Propulsion Laboratory, Pasadena, Calif.) In Sharing the

sun Solar technology in the seventies, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976 Volume 6  
Cape Canaveral, Fla., International Solar Energy Society, 1976, p. 48-56 ERDA-sponsored research, Contract No NAS7-100

The primary objective of the Low-cost Silicon Solar Array (LSSA) Project, which forms a major part of a national photovoltaic program, is the timely development of low-cost commercial-quality photovoltaic arrays through an active program of industrial and academic involvement. The definition of future array requirements is considered as a necessary step toward meeting this objective. An overview of array requirement trends which begin to evolve from the various ERDA activities is presented. For present terrestrial arrays the primary requirement is to generate power for small, often remote electric-power applications. To meet an objective of increased energy independence requires that photovoltaics become economically viable for the large energy consumption of the future. Various developments needed to achieve such an economic viability are discussed  
G R.

**A77-49054 \*** Large area Czochralski silicon for solar cells. S. N. Rea and G. F. Wakefield (Texas Instruments, Inc., Dallas, Tex.). In Sharing the sun Solar technology in the seventies, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976 Volume 6. Cape Canaveral, Fla., International Solar Energy Society, 1976, p. 57-66. 6 refs. NASA-ERDA-supported research

A detailed model of a typical Czochralski silicon crystal puller is utilized to predict maximum crystal growth rate as a function of various furnace parameters. Results of this analysis, when combined with multiblade slurry sawing, indicate that the Czochralski process is highly attractive for achieving near-term cost reduction of solar cell silicon.

**A77-49056** Status of the ERDA photovoltaic materials and device studies. D. M. Warschauer (ERDA, Washington, D.C.). In Sharing the sun Solar technology in the seventies, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976 Volume 6. Cape Canaveral, Fla., International Solar Energy Society, 1976, p. 73-78.

A number of techniques and systems concepts currently under investigation could, when successfully developed, make it possible to reach a cost of 50 cents or lower a peak watt by 1986. A description is presented of studies related to the long-term goal of 10 to 30 cents per peak watt by the turn of the century if not before. The studies involve an evaluation of the possibilities presented by an employment of novel materials and devices. Attention is given to the investigation of heterostructure configurations on single crystal silicon, the characteristics of silicon, gallium arsenide, cadmium sulfide-cuprous sulfide, indium phosphide, cadmium indium selenide, cadmium telluride, cuprous oxide, thin polycrystalline films of silicon and gallium arsenide on a low-cost substrate, and solar device lifetime considerations

Cape Canaveral, Fla., International Solar Energy Society, 1976, p. 79-92. 9 refs. Contract No. E(11-1)-2748

**A77-49058** Terrestrial concentrating photovoltaic power system studies. D. L. Evans and L. W. Florschuetz (Arizona State University, Tempe, Ariz.). In: Sharing the sun: Solar technology in the seventies; Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976, Volume 6. Cape Canaveral, Fla., International Solar Energy Society, 1976, p. 93-105. 6 refs. Contract No. E(11-1)-2590.

Studies aimed at defining the role of sunlight concentration in reducing the cost of electrical energy generated by terrestrial photovoltaic systems are described. These studies use computer modeling to (a) compare silicon cells and gallium arsenide cells in concentrating systems, (b) investigate the operation of photovoltaic systems in low insolation locations and (c) evaluate the effect of wind dependent thermal conductances on performance of passively cooled systems. Optimum fixed energy costs occur at higher aperture to cell area ratios for GaAs systems compared to silicon systems due to the better high temperature performance and increased costs of GaAs. Results based on currently available data show that concentrating systems should not be ruled out relative to fixed flat unconcentrated arrays even for low solar irradiation locations such as Cleveland. The wind dependent thermal conductance studies show that for precise modeling the effect of wind speed should be considered in locations having larger wind speed deviations from the yearly mean. However, with the present uncertainties in cost inputs, the use of average values is quite appropriate.

**A77-49059** CdS/Cu<sub>2</sub>S solar cells - A low-cost thin film polycrystalline photovoltaic device for terrestrial applications. J. D. Meakin, B. Baron, K. W. Boer, L. Burton, W. Devaney, H. Hadley, Jr., J. Phillips, A. Rothwarf, G. Storti, and W. Tseng (Delaware University, Newark, Del.). In Sharing the sun Solar technology in the seventies, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976 Volume 6. Cape Canaveral, Fla., International Solar Energy Society, 1976, p. 113-119. 13 refs. NSF Grant No. AER-72-03478.

The conversion efficiency of cadmium sulfide solar cells has shown progressive improvement and now exceeds 7-1/2%. The structure and operation of the cell is now sufficiently well understood that cells can be produced reliably and the potential for further improvement in efficiency assessed. Improved gridding procedures allow adjustment of the copper sulfide stoichiometry to give maximum short circuit current without loss in fill factor or open circuit voltage. The achievable efficiency of the CdS/Cu<sub>2</sub>S cell is assessed and the potential for further improvement by utilization of mixed zinc cadmium sulfides presented.

**A77-49062** CuInSe<sub>2</sub>/CdS thin film solar cells. L. L. Kazmerski (Maine University, Orono, Me.). In Sharing the sun Solar technology in the seventies, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976 Volume 6. Cape Canaveral, Fla., International Solar Energy Society, 1976, p. 150-158. 11 refs. NSF-supported research.

The fabrication and characterization of several thin film p-CuInSe<sub>2</sub>/n-CdS heterojunction solar cells are presented. Two

modes of operation, involving illumination either through the  $\text{CuInSe}_2$  or the  $\text{CdS}$  layer, are discussed. Efficiencies in the range 4-5% are reported and the spectral response characteristics are presented for these heterojunctions. The forward J-V characteristics indicate the domination of the generation-recombination mechanism. Device parameters ( $V_{\text{sub OC}}$ ,  $I_{\text{sub SC}}$ , FF and eta) are summarized (Author)

**A77-49063** The Alcoa 655 selective surface for aluminum. J H Powers, A G Craig, Jr, and W King (Alcoa Technical Center, Alcoa Center, Pa.) In Sharing the sun Solar technology in the seventies, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976. Volume 6. Cape Canaveral, Fla., International Solar Energy Society, 1976, p 166-186. 23 refs.

A selective surface (a coating composed almost entirely of aluminum and oxygen) has been developed for use on aluminum solar collector absorber surfaces, which offers a cost effective solution to the problem of reducing thermal losses and increasing the efficiency of collection. The advantages of the selective surface, designated the Alcoa 655 Process, are good stability, low cost, and availability on full-size collectors. Coating properties, cost and availability are reviewed and results of absorptivity, emissivity, weather-ometer, and fade-o-meter tests are presented. B J

**A77-49064** Analytical and experimental treatment of a spray-on selective coating - Application to collector design. C S Moore, T S Ashley, III, and H A Blum (Southern Methodist University, Dallas, Tex.) In Sharing the sun Solar technology in the seventies, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976. Volume 6. Cape Canaveral, Fla., International Solar Energy Society, 1976, p 187-204. 7 refs. Research supported by the Dallas Power and Light Co.

The paper describes a spray-on selective coating, utilizing a commercially available paint (the major pigment being black iron oxide) for solar collector surfaces, that has been applied to plain steel, galvanized steel and aluminum substrates. The absorptivity/emissivity curve obtained by experiment suggests the existence of an optimal absorptivity/emissivity set which would maximize the useful energy from a collector. A method developed by Tabor (1967) for optimizing selective coatings for any specified set of operating conditions (collection temperature, average insolation, etc.) is described. B J

**A77-49065** Solar energy utilization, solid state science, and a high efficiency amorphous-silicon absorber. R W Griffith (Argonne National Laboratory, Argonne, Ill.) In Sharing the sun Solar technology in the seventies, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976. Volume 6. Cape Canaveral, Fla., International Solar Energy Society, 1976, p 205-215. 20 refs. ERDA-supported research.

The electronic properties of non crystalline, i.e., amorphous, silicon (a-Si) have interesting consequences for solar energy utilization. Of particular interest is the enhanced optical absorption coefficient  $\alpha_{\text{sub } \lambda}$  in thin films of a-Si. Depending upon film preparation and operating conditions, such  $\alpha_{\text{sub } \lambda}$  profiles offer the following advantages relative to crystal-Si films. These are: (1) a 'tunable' position of the absorption edge that allows red shifts to nearly  $\lambda_{\text{sub } g}$  equals 2.1 microns and (2) a steep profile shape that can rapidly attain  $\alpha_{\text{sub } \lambda}$  of about 10 to the 5th to 10 to the 6th/cm near the center of the AM2 solar spectrum. In solar thermal conversion, a principal potential application is that of a high-efficiency thin-film selective absorber coating. In photovoltaic conversion, application can be made to super-shallow a-Si junctions as recently reported by several groups in the literature. (Author)

**A77 49067 \*** Considerations in the development of a high performance per unit cost solar collector. W H Sims (Chamberlain Manufacturing Corp., Waterloo, Iowa.) In Sharing the sun Solar technology in the seventies, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976. Volume 6.

Cape Canaveral, Fla., International Solar Energy Society, 1976, p 240-254. Contract No. NAS8-31326.

A flat plate collector employing a mild steel, pressure expanded absorber plate has been developed. It is capable of energy output levels commensurate with the requirements of driving an absorption refrigeration system while operating at efficiency levels in the 35-40% range. Selective absorber surfaces of black chrome over nickel and black copper over copper were analyzed and prototype collectors containing each type of absorber plating were fabricated and tested for performance. Criteria applied to the cost effectiveness analysis of the collector included both the energy output per unit area and the collector fabrication cost per unit area. B J

**A77-49068** Application of aluminum alloys for solar heating and cooling systems. R A Bonewitz, W King, and A G Craig, Jr (Alcoa Technical Center, Alcoa Center, Pa.) In Sharing the sun Solar technology in the seventies, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976. Volume 6. Cape Canaveral, Fla., International Solar Energy Society, 1976, p 255-273. 6 refs.

Aluminum alloys are an excellent material of construction for solar collectors because of their low weight, good strength and formability, low cost and natural resistance to atmospheric corrosion. Consideration must be given in thermal fluid selection to avoid general or pitting corrosion and in system design to avoid galvanic, crevice or erosion corrosion. In closed systems, aluminum alloys have been employed in multimetallic heating and cooling systems charged with untreated deionized or distilled water, and where they have been shown to be non-aggressive to aluminum, with some untreated natural waters. The use of suitable corrosion inhibitors is recommended for long service life. In open systems treatment is required because of concentration of the water and oxygen ingress. Ten year service experience with aluminum automobile radiators indicates that aluminum can be employed with inhibited ethylene glycol solutions with reasonable attention to the solution chemistry. (Author)

**A77-49069** Use of getters in evacuated solar collectors. W S Carter and J H H King (King Laboratories, Inc., Syracuse, N.Y.) In Sharing the sun Solar technology in the seventies, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976. Volume 6. Cape Canaveral, Fla., International Solar Energy Society, 1976, p 274-288. 16 refs.

The use of a getter in evacuated solar collectors is discussed. Heat conduction through an annulus has been found for gases at low pressures and at a range of possible operating temperatures. The pressure necessary to reduce conduction heat loss to a small value is 0.004 torr for a 2 inch O.D. glass envelope. Barium metal is useful in maintaining a vacuum of less than 0.004 torr. The gettering capacity of barium by gas specie is explained. The amount of barium necessary to properly maintain a vacuum for a 10 to 20 year collector life is discussed. Activation of the getter by induction heating is discussed. Typical performances of the getter regarding barium yield and begin of flash are illustrated. (Author)

**A77-49070** The weatherability of solar energy utilization materials - Preliminary discussions. J E Gilligan and J Brzuskiwicz (IIT Research Institute, Chicago, Ill.) In Sharing the sun Solar technology in the seventies, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976. Volume 6. Cape Canaveral, Fla., International Solar Energy Society, 1976, p 289-302. Contract No. E(11-1)-578-PA-34.

## A77-49071

**A77-49071** *Prisms with total internal reflection as solar reflectors* A Rabl (Argonne National Laboratory, Argonne, Ill ) In *Sharing the sun Solar technology in the seventies, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976 Volume 6* Cape Canaveral, Fla., International Solar Energy Society, 1976, p 303-315. 10 refs ERDA-supported research

In certain solar collectors, conventional mirrors can be replaced by an array of small rectangular glass prisms with total internal reflection (TIR) The suitability of TIR prismatic reflectors for solar energy collection is investigated systematically, and the following applications are found to be promising (1) heliostats for central receiver, (2) parabolic reflectors with point focus, (3) line focus systems (both parabolic and Fresnel reflectors) tracking around north-south axis, provided the tilt of the system is adjusted seasonally, (4) under some conditions, V- and Compound Parabolic Concentrators, in trough or cone geometry Reflection at the front surface of a prism will split any incident ray into separate rays which may leave the prism in two different directions However, in all the designs considered here, all these rays will reach the absorber, and thus the effective reflectivity is indeed 100% apart from absorption losses (Author)

**A77-49072** *Reflection coefficient for a back-surface glass mirror* T Kent (Pennsylvania State University, University Park, Pa ) and L L Vant-Hull (Houston, University, Houston, Tex ) In *Sharing the sun Solar technology in the seventies, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976 Volume 6* Cape Canaveral, Fla., International Solar Energy Society, 1976, p 316-324 11 refs NSF Grant No GI-39456

The variation of the reflectivity of a back-surface glass mirror with respect to the angle of incidence was studied with consideration of multiple reflections, polarization, spectral characteristics of the absorptivity and reflectivity, and thickness and absorptivity of the glass In most cases of interest, the reflectivity varies only a few percent for angles of incidence between plus and minus 80 deg and goes to unity at grazing incidence (90 deg) A 6 mm thick float glass mirror with a back-surface silver coating was used in these experiments Data for wavelength dependencies are presented, and a theoretical analysis of the optics of the system is provided Many systems, the solar tower in particular, use back-silvered mirrors to reflect the solar energy to a collector M L

**A77-49073** *On the use of solid-dielectric compound parabolic concentrators with photovoltaic devices* N B Goodman, L Wharton, R Winston (Chicago, University, Chicago, Ill ), and R Ignatius (M7 International, Arlington Heights, Ill ) In *Sharing the sun Solar technology in the seventies, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976 Volume 6* Cape Canaveral, Fla., International Solar Energy Society, 1976, p 325-330 Research supported by the University of Chicago

Prototype solid dielectric compound parabolic concentrators have been made and tested By means of the geometry and refractive properties of a transparent solid they provide a technique for increasing the power output of silicon solar cells exposed to the sun by an amount equal to the increase in effective collecting area The response is uniform over a large angle which eliminates the necessity of diurnal tracking of the sun The technique can be applied to the construction of thin panels and has the potential for significantly reducing their cost per unit area (Author)

**A77-49075** *Heat mirror - A practical alternative to the selective absorber* R M Winegarner (Optical Coating Laboratory, Inc., Santa Rosa, Calif ) In *Sharing the sun Solar technology in the seventies, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976 Volume 6* Cape Canaveral, Fla., International Solar Energy Society, 1976, p 339-348

Experimental data has been found to agree with calculations showing that a heat mirror coating, used in a two cover flat plate collector can be nearly as effective as a selective absorber coating In contrast to the selective absorber coating, which is applied to the absorber plate, the heat mirror coating is applied to the inner cover

glass This feature allows one to upgrade the performance of a flat black, two cover glass collector by the replacement of an uncoated inner cover with a coated one This retrofit will provide an absolute instantaneous efficiency increase of up to 10% and a relative daily performance increase of up to 20% (Author)

**A77-49076** *Fuels and chemicals from the sun through bioconversion* R H Bogan (Washington, University, Seattle, Wash ) In *Sharing the sun Solar technology in the seventies, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976 Volume 7* Cape Canaveral, Fla., International Solar Energy Society, 1976, p 2-6

Bioconversion solar energy technology promises to provide the basis for major renewable fuel supplies in the future Utilizing plant biomass materials as an energy feedstock, this technology is expected to supply the US with up to 15 Quads of energy in the form of fuels and industrial chemicals by the year 2020 Comparable global supplies appear feasible Agricultural and forest residues are the most promising near-term energy resources Terrestrial and marine energy farming systems are expected to become the dominant sources of biomass energy feedstocks after the year 2000 (Author)

**A77-49077** *Improved, inexpensive solar collectors for agricultural requirements* J H Schlag, D C Ray, A P Sheppard, and J M Wood (Georgia Institute of Technology, Atlanta, Ga ) In *Sharing the sun Solar technology in the seventies, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976 Volume 7* Cape Canaveral, Fla., International Solar Energy Society, 1976, p 22-32 Research sponsored by the Georgia Institute of Genetics, US Department of Agriculture Contract No 12 14-7001-566

This article compares four different types of low-cost agricultural solar collectors which can be used for crop drying, greenhouse heating, and heating animal shelters The types of collectors to be studied are a black film, hot air collector system, a rock absorption and storage collector system, a solar pond connector system, and a greenhouse collector system Selection criteria for the materials used in the collectors and problems encountered in the actual fabrication of the collectors will also be presented A study of the instrumentation and data acquisition system used to collect the solar systems performance data is presented A digital recording system forms the nucleus of this system A time multiplex scanner has been developed which can handle as many as sixty thermocouples monitoring various collector system points The measurements which are discussed are temperature, humidity, flow rates, insolation, wind speed, and wind direction (Author)

**A77-49078** *Design and performance of an air collector for industrial crop dehydration* P W Niles, E J Carnegie, J G Pohl, and J M Chern (California Polytechnic State University, San Luis Obispo, TRW, Inc., Systems and Energy Div., Redondo Beach, Calif ) In *Sharing the sun Solar technology in the seventies, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976 Volume 7* Cape Canaveral, Fla., International Solar Energy Society, 1976, p 88-99 7 refs NSF Grant No ERT-74-19063

Test results are reported for the operation of unglazed and single-glazed solar collectors used to heat air to the 200 F range The collectors were constructed of standard black-painted metal decking and were tested in various lengths so that pressure drops and convective heat transfer rates could be varied independent of collector operation temperature It is shown that the experimental collector performance results with single pass operation are in substantial agreement with standard collector analysis procedures These results give a firm basis for collector and system optimization with respect to life cycle costs (Author)

**A77-49079** *Silviculture energy plantations* R E Inman (Mitre Corp., McLean, Va ) In *Sharing the sun Solar technology in the seventies, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976 Volume 7* Cape Canaveral, Fla., International Solar Energy Society, 1976, p 100-103

A systems study of silviculture plantations to produce energy/chemical feedstock is underway. An analysis of biomass production costs is being performed for ten sites in the United States. Production scenarios will be combined with various biomass conversion scenarios to estimate final product costs. Final results will be reported in February, 1977. (Author)

**A77-49080** Field crops as a future source of fuels and chemical feedstocks. E. S. Lipinsky (Battelle Columbus Laboratories, Columbus, Ohio). In *Sharing the sun: Solar technology in the seventies*, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976. Volume 7. Cape Canaveral, Fla., International Solar Energy Society, 1976, p. 104-117. 5 refs. ERDA-supported research.

Such field crops as sugarcane, sorghums, sugar beets, wheat, and corn are under investigation as sources of fuels and commodity chemicals. Ethanol and methanol appear more attractive for industrial use than for fuel usage. Thermochemical production of fertilizer ammonia appears especially attractive. Genetic optimization, agronomic improvements, whole-plant harvesting, and hauling cost reductions may all be needed to fulfill the economic promise of this approach to ameliorating the hydrocarbon crisis. (Author)

**A77-49081** Methane production through bioconversion of agricultural residues. D. D. Schulte, E. J. Kroecker, A. B. Sparling, and H. M. Lapp (Manitoba, University, Winnipeg, Canada). In *Sharing the sun: Solar technology in the seventies*, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976. Volume 7. Cape Canaveral, Fla., International Solar Energy Society, 1976, p. 119-128. 26 refs. Research supported by the Biomass Energy Institute, University of Manitoba, Agricultural Institute of Canada, and Shell Canada.

Bioconversion of agricultural residues to methane gas has been restricted in the past by lack of understanding of process performance at the high organic loading rates and high organic solids concentrations normally associated with animal manures and crop residues. Experiments at the University of Manitoba carried out at organic loading rates several times that normally associated with sewage sludge digestion and at ammonia concentrations far above that formerly thought to be toxic to methane producing bacteria have shown extreme process stability. These and other results indicate that there may be a useful role for anaerobic digestion in the formulation of practical and economic farm-scale bioconversion units. (Author)

**A77-49082** A feasibility study of bio-gas production in individual farms in Southwestern Ontario. C. M. Ostrovski, N. Peters, and J. L. Sullivan (Western Ontario, University, London, Canada). In *Sharing the sun: Solar technology in the seventies*, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976. Volume 7. Cape Canaveral, Fla., International Solar Energy Society, 1976, p. 129-145. 12 refs.

A mathematical model has been developed to examine the economic feasibility of building small digesters for single-farm utilization (on a scale of about 200 acres) to produce energy (methane gas) and fertilizer from renewable resources (crop residue and animal waste). The model considers (1) the volume of the gas needed, (2) the quantity of heat needed to operate the digester, (3) the volume and cost of a digester to produce enough heat for purposes 1 and 2, (4) the amounts of residue required and fertilizer produced, and (5) a comparison of the cost of building and operating the digester and the benefits achieved. The MOSES computer program for solving the model is presented. Some case studies relating to farms in Southwestern Ontario are discussed. B. J.

**A77-49083** Agricultural and forestry wastes as an energy resource. J. A. Alich, Jr. and J. G. Witwer (Stanford Research Institute, Menlo Park, Calif.). In *Sharing the sun: Solar technology in the seventies*, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976. Volume 7. Cape Canaveral, Fla., International Solar Energy Society, 1976, p. 146-156.

The feasibility of converting agricultural and forestry residues to energy is evaluated based on a county-by-county inventory for the conterminous United States. The impact of this energy resource on the U.S. energy system is forecast using the SRI energy model.

**A77-49085** Preliminary assessment of the potential for medium and large capacity wind generators used as fuel savers for ac diesel based power systems in Ontario. R. M. R. Higin and C. K. Brown (Ontario Ministry of Energy, Toronto, Ontario Research Foundation, Mississauga, Canada). In *Sharing the sun: Solar technology in the seventies*, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976. Volume 7. Cape Canaveral, Fla., International Solar Energy Society, 1976, p. 180-194. 5 refs.

**A77-49086** Some legal-institutional implications of offshore wind energy conversion systems. L. H. Mayo (George Washington University, Washington, D.C.). In *Sharing the sun: Solar technology in the seventies*, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976. Volume 7. Cape Canaveral, Fla., International Solar Energy Society, 1976, p. 195-214. 28 refs.

Wind energy conversion systems (WECS) are being given systematic attention in the U.S. although the effort to date is still in a relatively preliminary stage. Studies underway or proposed are expected to provide needed data concerning technological practicability, economic competitiveness, and socio-political acceptability of wind energy systems. Some attention is being given specifically to offshore WECS configurations. Offshore WECS present unique problems, particularly of a legal-institutional nature, including potentially conflicting National-International and Federal-State jurisdictional claims, competing sea area uses, land use management, utility policy and regulation, and incentives to utilize innovative energy technologies. The existing array of Federal energy statutes appears to provide an adequate legal framework for vigorous research, development and demonstration programs. But it may become advisable to enact specific legislation to eliminate or ameliorate certain constraints on the implementation of offshore WECS if significant private sector participation is to be encouraged.

**A77-49087** Wind-electric conversion utilizing field modulated generator systems. R. Ramakumar (Oklahoma State University, Stillwater, Okla.). In *Sharing the sun: Solar technology in the seventies*, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976. Volume 7. Cape Canaveral, Fla., International Solar Energy Society, 1976, p. 215-229. 24 refs. ERDA-supported research, NSF Grant No. AER-75-00647.

Variable-speed constant-frequency wind-electric systems operate at a constant tip speed ratio with varying wind speeds and enable the extraction of a part of the energy spilled by constant-speed constant-frequency systems. This paper describes the variable-speed constant-frequency wind-driven field modulated generator system under development at Oklahoma State University, sponsored by ERDA/NSF. Proposed control schemes and the experimental re-

search program underway are briefly discussed. These systems appear to be most attractive in the 'small' (10 to 50 kW) and '100 kW scale' (50 to 250 kW) sizes and for use in large capacity 'multirotor on one tower' concepts (Author)

**A77-49088 Synchronous inversion - Concept and application** H Meyer In Sharing the sun Solar technology in the seventies, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976 Volume 7 Cape Canaveral, Fla., International Solar Energy Society, 1976, p 230-242

Synchronous inversion involves the use of intermittent and/or variable power sources (wind, solar electric, solar thermal, hydro, tidal, wave, ocean thermal, industrial waste heat, etc.) to supplement a primary power source (anything from a 10 kilowatt diesel/generator set to a coast to coast utility grid). The requirements of the primary power source are that it be of greater capacity and lower impedance, so that it has the ability to dictate voltage and frequency and that it be present any time the alternate power source is in use. Synchronous inversion uses an ac power network as a 'storage' medium for any form of energy that can be converted to dc power, and at the same time takes advantage of the ac power source to establish both the voltage and frequency of the converted power. This paper examines synchronous inversion from the points of view of the theory of operation, metering, system design and interfacing. B J

**A77-49089 Energy content of winds in the high plains region of southwestern U.S.** O D Sittler (Eastern New Mexico University, Portales, N Mex.) In Sharing the sun Solar technology in the seventies, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976, Volume 7 Cape Canaveral, Fla., International Solar Energy Society, 1976, p 243-252

Winds at Portales, New Mexico are being studied to assess the amount of wind energy available and its distribution in time. The analysis includes the effect of short-term variations in wind speed, or gusts, in the calculation of total energy content. Data collected between November, 1975 and April, 1976 indicate that average wind speed exceeds 4.5 m/sec for 9.6 hrs/day on the average. During these hours, the average energy flux per day is about 2.2 kwhr per square meter. Sequences of 4 or 5 days having energy flux less than 1.0 kwhr per square meter seldom occur, thus, wind could supply energy in this region on a regular basis with the help of energy storage or through procedures which match energy demand to times when wind energy is available (Author)

**A77-49090 The use of built form to enhance the output of wind collectors** D R Coonley (Design-Research-Consulting, Harrisville, N.H.) In Sharing the sun Solar technology in the seventies, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976 Volume 7 Cape Canaveral, Fla., International Solar Energy Society, 1976, p 253-267 14 refs

Buildings often give rise to extreme wind velocities at ground level, especially when there is an open area for the wind to pass through. This paper considers the possibility of utilizing the wind ducting capabilities of built structures in an attempt to gain better use of and increased energy output from wind energy conversion systems. Attention is given to the integration of wind collector systems with buildings. The variation of fixed wind collector output with variation in wind direction is studied and methods for reducing wind problems around buildings are examined. B J

**A77-49091 Wind energy statistics for large arrays of wind turbines - New England and Central U.S. regions.** C G Justus (Georgia Institute of Technology, Atlanta, Ga.) In Sharing the sun Solar technology in the seventies, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976 Volume 7

Cape Canaveral, Fla., International Solar Energy Society, 1976, p 268-288 NSF Grant No GAER-75-00647, Contract No E(40-1)-5108

The performance characteristics have been simulated for large dispersed arrays of 500 kW-1500 kW wind turbines producing power and feeding it directly into the New England or Central U.S. utility

distribution grids. These studies show that in good wind environments the 500 kW generators can average (on an annual basis) up to 240 kW mean power output, and the 1500 kW generators can average up to 350 kW mean power output. Better performance (averaging up to 470 kW) is obtained, however, by an 1125 kW rated power unit designed to operate at lower wind speeds. The beneficial effect of operating large dispersed arrays of wind turbines is that available power output can be increased - if winds are not blowing over one part of the array, chances are they will over some other part of the array. These studies indicate that wind power availability levels of 200 kW per 1125 kW generator were 77% to 93%, depending on season. Reasonably steady high wind power in winter and high afternoon peak wind power in summer (corresponding to peak air conditioning load) means that significant peak load dispersion can be achieved without use of storage (Author)

**A77-49092 The application of wind power systems to the Minnesota Power and Light Company** F S Malver (Honeywell, Inc., Minneapolis, Minn.) and L D Overom (Minnesota Power and Light Co., Duluth, Minn.) In Sharing the sun Solar technology in the seventies, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976 Volume 7 Cape Canaveral, Fla., International Solar Energy Society, 1976, p 289-303 6 refs Contract No E(11-1)-2618

A Honeywell study was conducted to assess current Wind Energy Conversion System (WECS) viability for a utility application and to define the attributes and performance requirements of a system capable of yielding a satisfactory return on investment to a utility company. Minnesota Power and Light Company has served as the case study subject utility. An initial system definition based on available wind information and near-term wind turbine generator technology is given. A WECS simulation to convert wind data to wind energy available to the utility's grid was developed along with simulations for evaluating baseline wind turbine generators and an advanced technology wind turbine. B J

**A77-49093 Diffuser augmentation of wind turbines** K M Foreman, B Gilbert, and R A Oman (Grumman Aerospace Fluid Dynamics Laboratory, Bethpage, N.Y.) In Sharing the sun Solar technology in the seventies, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976 Volume 7

Cape Canaveral, Fla., International Solar Energy Society, 1976, p 304-316 9 refs Contract No E(11-1)-2616

The Diffuser-Augmented Wind Turbine (DAWT) is an advanced concept for reducing the cost per output KW-hr of windpower. The diffuser controls the expansion of turbine exhaust flow, producing a highly subatmospheric pressure at the turbine exit, the low static pressure induces greater mass flow through the turbine vs a conventional turbine design of the same diameter. Two cost-effective model configurations were examined in the wind tunnel: one uses the energetic external wind to prevent separation of the diffuser's internal boundary layer, while the other uses high lift airfoil contours for the diffuser wall shape. The wind tunnel tests have indicated almost a doubling of wind power extraction capability for DAWTs compared to conventional turbines. B J

**A77-49094 Large windpower systems integrated with existing electric utilities** R T Smith, R K Swanson, C C Johnson (Southwest Research Institute, San Antonio, Tex.), C Ligon (Southwestern Public Service Co., Amarillo, Tex.), J Lawrence, and D. Jordan (Texas Tech University, Lubbock, Tex.) In Sharing the sun Solar technology in the seventies, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976 Volume 7

Cape Canaveral, Fla., International Solar Energy Society, 1976, p 317-327 Contract No E(11-1)-2621

This paper reports a study of the feasibility of the use of wind turbine generators as supplemental energy sources on an existing electric utility network. The time frame is the period of the next two decades. Specifically, the study is centered upon the geographical region served by Southwestern Public Service Company, an investor owned utility with present capacity of approximately 2200MW. It includes the panhandles of Texas and Oklahoma, parts of eastern

New Mexico and some communities in southwestern Kansas. Of prime importance, this region exhibits the highest wind energy potential of any area of comparable size in the continental United States (Author)

**A77-49095 Self-regulating composite bearingless wind turbine** M C Cheney and P A M Spierings (United Technologies Research Center, East Hartford, Conn.) In *Sharing the sun Solar technology in the seventies, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976 Volume 7*, Cape Canaveral, Fla., International Solar Energy Society, 1976, p 328-348 6 refs

The Composite Bearingless Rotor (CBR) concept has been shown to have characteristics ideally suited for wind turbine applications. Originally developed for helicopters to reduce weight, costs, and complexity, the CBR eliminates blade bearings and hinges through the utilization of the unique structural characteristics of uniaxial composite materials. This rotor concept was further developed under an ERDA contract to provide a fully self-regulating and self-aligning wind turbine. Such a system was achieved without the need for auxiliary controls or sensors. These features allow self-starting for wind initiating from any direction and automatic pitch and yaw variations to optimize performance under all normal wind conditions. The work described in this report consists of the design and fabrication of a 4.5 ft dynamically scaled wind turbine model and the successful testing of this model in the United Technologies Research Center low speed wind tunnel (Author)

**A77-49096 The Darrieus Vertical-Axis Wind Turbine program at Sandia Laboratories** E G Kadlec (Sandia Laboratories, Albuquerque, N Mex.) In *Sharing the sun Solar technology in the seventies, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976 Volume 7*, Cape Canaveral, Fla., International Solar Energy Society, 1976, p 349-359 8 refs ERDA-supported research

The vertical-axis wind turbine (VAWT) consists of blades having an airfoil cross section which are attached at both ends to a vertical rotating shaft and has the following advantages over conventional turbines: no need for yaw control, the delivery of mechanical power at ground level, simple support tower construction, and no pitch control required for synchronous application. The program at Sandia Laboratories emphasizes the use of the VAWT operating at constant speed to generate electricity which is fed directly into a utility grid. The program has concentrated on the development of analytical capability in support of the VAWT design, the analyses partially confirmed by testing of the existing 5 meter turbine B.J

**A77-49098 Application of chemical engineering to large scale solar energy** T A Chubb, J J Nemecek, and D E Simmons (US Navy, E O Hulburt Center for Space Research, Washington, D C.) In *Sharing the sun Solar technology in the seventies, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976 Volume 7*, Cape Canaveral, Fla., International Solar Energy Society, 1976, p 364-374

The paper describes the Solchem concept, according to which sunlight is converted to chemical energy in dispersed solar furnaces. The Solchem power station consists of the following components: (1) an energy orchard containing dispersed solar-furnace-heated chemical reactors, (2) an assemblage of demand responsive energy storage-boiler tanks, in which large quantities of energy are stored as latent heat-of-fusion, and (3) a conventional dry steam turboelectric generating facility. The solar orchard is characterized by the use of a gas phase working fluid both for the capture of solar thermal energy by dissociative chemical reaction and for delivery of the captured energy to the central station area. A detailed comparison of SO<sub>3</sub> and steam-methane working fluids is presented B.J

**A77-49099 High temperature thermal energy storage** R M Green, D K Ottesen, J J Bartel, and T T Bramlette (Sandia Laboratories, Livermore, Calif.) In *Sharing the sun Solar technology in the seventies, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976 Volume 8*, Cape

Canaveral, Fla., International Solar Energy Society, 1976, p 4-47 124 refs Contract No AT(29-1) 769

This paper presents the results of a survey of current technology relating to high temperature thermal energy storage. Included in this study are the generic classes of sensible heat and latent heat storage. A summary is given of thermal storage concepts which have been designed - and in some cases constructed and tested - for high temperature applications. A review of the materials and heat transfer/fluid mechanics technologies relating to thermal storage is presented. Current technology appears to be adequate to support the development of most sensible heat concepts and simple latent heat concepts while some degree of technology advancement will be required to develop more sophisticated latent heat concepts (Author)

**A77-49100 Chemical methods of storing thermal energy** P O Offenhartz (EIC Corp., Newton, Mass.) In *Sharing the sun Solar technology in the seventies, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976 Volume 8*, Cape Canaveral, Fla., International Solar Energy Society, 1976, p 48-72 27 refs

Thermal energy storage through chemical reactions is reviewed including second-law restrictions and opportunities. Second-law opportunities arise when the collection temperature exceeds the utilization temperature, in this case a thermochemically driven heat pump can be used to deliver considerably more heat than is collected. Chemical reactions can be chosen to fit the source and sink temperatures so as to amplify the input heat. A number of currently proposed methods (H<sub>2</sub> generation and storage, hydration-dehydration equilibria, chemical heat pipes, and ammoniacal salt pairs) are assessed with respect to efficiency, cost, chemical feasibility, and suitability for various collection and utilization temperatures (Author)

**A77-49101 Gravel and liquid storage system for solar thermal power plants** R C Mitchell, G R Morgan (Rockwell International Corp., Rocketdyne Div., Canoga Park, Calif.), and G Coleman (McDonnell Douglas Astronautics Co., Huntington Beach, Calif.) In *Sharing the sun Solar technology in the seventies, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976 Volume 8*, Cape Canaveral, Fla., International Solar Energy Society, 1976, p 84-94 Contract No E(04-3)-1108

A new thermal storage concept is described which uses a low-cost rock bed as the primary storage medium with a suitable liquid to transfer the heat in and out of storage. Key developments are described from a current program funded by the US Energy Research and Development Administration. A preliminary design is described for the thermal storage subsystem in a 10 megawatt (electrical) pilot plant central receiver solar thermal power system. Also described is a 4 megawatt-hour capacity thermal storage system which has been designed and constructed, and will be tested during 1976 (Author)

**A77-49102 Demand sensitive energy storage in molten salts** J J Nemecek, D E Simmons, and T A Chubb (US Navy, Naval Research Laboratory, Washington, D C.) In *Sharing the sun Solar technology in the seventies, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976 Volume 8*, Cape Canaveral, Fla., International Solar Energy Society, 1976, p 95-106

The energy storage-boiler tank concept is explained, and experimental results are presented for a material set in which a NaCl-KCl-MgCl<sub>2</sub> eutectic (MP = 385 C) is the storage medium and m-terphenyl is the heat pipe fluid. In an energy storage-boiler tank, heat energy would be stored as latent heat-of-fusion in a eutectic of naturally occurring salts, and input-output heat transfer would be effected by evaporation-condensation of a heat pipe energy transport fluid. The design of a proposed 3 m energy storage-boiler tank is described. Melt-freeze time histories of Solchemite A, a melt-cycled mix of NaCl KCl MgCl<sub>2</sub> = 24.5 20.5 55.0%, are portrayed. The components of other material sets for energy storage-boiler tanks are listed M.L.

**A77-49103 Inorganic phase change materials for energy storage in solar thermal program** R T LeFrois (Honeywell Energy Resources Center, Minneapolis, Minn) and H V Venkatesetty (Honeywell Corporate Research Center, Bloomington, Minn) In *Sharing the sun Solar technology in the seventies, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976 Volume 8* Cape Canaveral, Fla., International Solar Energy Society, 1976, p 107-122

The thermal storage subsystem research experiment is described, and the design of the thermal storage tank is explained. Test features of the thermal storage subsystem include an instrumented forced circulation steam generating system, an instrumented steam condensing system, an instrumented storage tank, and an instrumental dual steam trap station. Vaporizer design parameters and condenser design parameters are presented. Vaporizer tube scrapers are considered. Experimental data concerning the behavior of a eutectic mixture of  $\text{NaNO}_3\text{-NaOH}$ , the thermal energy storage material, are provided. The research experiment is intended to aid the design of a solar pilot plant. M L

**A77-49104 High-temperature energy storage in native rocks** M Riaz, P L Blackshear, Jr, and H O Pfannkuch (Minnesota, University, Minneapolis, Minn) In *Sharing the sun Solar technology in the seventies, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976 Volume 8* Cape Canaveral, Fla., International Solar Energy Society, 1976, p 123-137 7 refs Contract No E(11-1)-4009

The successful utilization of thermal energy derived from solar collectors, from off-peak excess thermal energy of power plants, and from industrial process or waste heat systems is predicated upon the development of suitable storage systems which provide the necessary buffer and matching function between the time-varying thermal energy inputs and the output thermal and electrical loads. This paper explores the technical feasibility of large-volume packed beds using native earth or rock materials for long-duration (months) storage of thermal energy at high temperatures (up to 500 C) and power levels (in the tens of MWt range) compatible with electric power generation and community heating in total energy systems context. The advantages of this storage concept derive from the inherent simplicity of the overall system, from its utilization of low-cost, on-site, native materials resulting in potentially minimum environmental impact, and from the increased energy density obtainable with large temperature swings. A generic configuration of heat accumulators involving arrays of pebble-filled trenches (or holes) surrounded by undisturbed earth and fed by hot air from above or below is examined. (Author)

**A77-49105 Thermal storage in metals** C E Birchenall and M Telkes (Delaware, University, Newark, Del) In *Sharing the sun Solar technology in the seventies, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976 Volume 8* Cape Canaveral, Fla., International Solar Energy Society, 1976, p 138-154

Halides and oxides with phase transformations or eutectics in the range of 200 to 800 C have been studied as heat storage materials. Several abundant and cheap metals, notably Al, Cu, Mg, Si, and Zn as binary or more complex alloys, have eutectic transformations that store comparable or larger amounts of heat. Their high molar densities yield small storage volumes, and high thermal conductivities simplify heat transfer. Containment should be easier than for oxides and halides. Thermodynamic theory shows that alloys selected for heat storage should have highly disordered eutectic liquids that freeze to well-ordered strongly bonded solid phases. Heat storage in several promising binary and ternary alloys for which data are available has been estimated at three levels of approximation to illustrate the approach that is being used to identify suitable systems and the uncertainties that need to be resolved by additional experiments. (Author)

**A77-49106 \* Thermal energy storage using large hollow steel ingots.** R H Turner (California Institute of Technology, Jet Propulsion Laboratory, Pasadena, Calif) In *Sharing the sun Solar*

*technology in the seventies, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976 Volume 8*

Cape Canaveral, Fla., International Solar Energy Society, 1976, p 155-162 Contract No NAS7-100

High temperature thermal energy storage (to 500 C = 930 F) using hollow steel ingots is investigated. Preliminary studies indicate that the system should be reliable, be characterized by low operation and maintenance costs, and be associated with low development risk. The estimated installed system energy unit storage cost is \$13 50/kWh-t. (Author)

**A77-49107 An assessment of hydrogen as a means to store solar energy** R Ramakumar (Oklahoma State University, Stillwater, Okla) In *Sharing the sun Solar technology in the seventies, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976 Volume 8* Cape Canaveral, Fla., International Solar Energy Society, 1976, p 163-175 28 refs ERDA-supported research, NSF Grant No AER-75-00647

A brief review and assessment of the use of hydrogen as a means to store solar energy is presented. Electrolytic and non electrolytic methods proposed for hydrogen production from solar energy, hydrogen storage methods and utilization techniques are surveyed. Overall system concepts with several manifestations of solar energy as inputs are discussed along with their efficiencies and economic aspects. (Author)

**A77-49108 Thermal energy storage by the sulfuric acid-water system** D D Huxtable and D R Poole (Rocket Research Corp, Redmond, Wash) In *Sharing the sun Solar technology in the seventies, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976 Volume 8* Cape Canaveral, Fla., International Solar Energy Society, 1976, p 178-191 8 refs Contract No E(04-3)-1185

The sulfuric acid-water storage system utilizes solar thermal energy to evaporate water from a sulfuric acid-water solution. The sulfuric acid and water are stored separately until heat is required. Upon recombination of the concentrated acid and water, heat is released which can be used for building heating and cooling, water pumping, or other uses. Results of an investigation aimed at defining potential problem areas and providing practical solutions are presented. Potential applications of the system are discussed, and preliminary design and cost information on a seasonal storage application is presented. (Author)

**A77-49109 Storage of solar energy by inorganic oxide/hydroxides** G Bauerle, D Chung, G Ervin, J Guon, and T Springer (Rockwell International Corp, Atomics International Div, Canoga Park, Calif) In *Sharing the sun Solar technology in the seventies, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976 Volume 8* Cape Canaveral, Fla., International Solar Energy Society, 1976, p 192-218 5 refs ERDA-sponsored research, NSF Grant No AER-74-09069

A novel thermal-energy storage concept involving the use of inorganic oxides/hydroxides such as  $\text{MgO/Mg(OH)}_2$  and  $\text{CaO/Ca(OH)}_2$  is under investigation. Solar energy at high temperatures (about 350 to 550 C) is used to drive off, in the form of steam, the chemically bound water from the hydroxide. At a later time, when the sun's energy is not available, water or steam can be injected into the resulting oxide material, thus yielding heat energy from the exothermic reaction of water with the oxide. The physical and chemical properties of the  $\text{MgO/Mg(OH)}_2$  systems, particularly the reaction rates, thermal conductivity, vapor pressure, and particle characteristics, have been investigated in detail. A reference design of an  $\text{MgO/Mg(OH)}_2$  storage system for heating and cooling of buildings has been prepared, and a variety of other applications of these systems have been studied. (Author)

**A77-49110 Reversible oxidation of metal oxides for thermal energy storage** J A Simmons (Science Applications, Inc, McLean, Va) In *Sharing the sun Solar technology in the seventies, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976 Volume 8* Cape Canaveral, Fla., International Solar Energy Society, 1976, p 219-225 12 refs

Decomposition of metal oxides, especially peroxides and super-oxides, are proposed as reversible reactions to store thermal energy. Certain oxides have potentially high energy density and could use air for the source of oxygen. Feasibility is yet to be demonstrated experimentally. (Author)

**A77-49111 Thermal energy storage with saturated aqueous solutions** K W Kauffman and H G Lorsch (Franklin Institute Research Laboratories, Philadelphia, Pa.) In *Sharing the sun Solar technology in the seventies, Proceedings of the Joint Conference*, Winnipeg, Canada, August 15-20, 1976 Volume 8

Cape Canaveral, Fla., International Solar Energy Society, 1976, p 227-237 Contract No E(40-1)-5158

A method of thermal energy storage at temperatures of 0 C to 120 C is being developed for application to solar space heating, water heating, and air conditioning. The method uses saturated aqueous solutions of salts which dissolve endothermically and have large coefficients of solubility with temperature. Latent heat of crystallization is continuously released on cooling and absorbed on heating, resulting in specific heat capacities up to 480 percent of the specific heat of water. Over a 10 C range of temperature, storage densities can be achieved which are in the same range as those of latent heat of fusion materials. Since the solutions are pumpable, systems employing them do not require the expensive container/heat exchangers characteristic of latent heat devices using phase change materials. Total costs for a 10 to the eighth joule storage device are 1/4 to 1/2 the cost of devices using sodium thiosulfate pentahydrate or 50% water-ethylene glycol. (Author)

**A77-49112 Experimental study of the subsurface transport of water and heat as related to the storage of solar energy** F J Moiz, J C Warman, T E Jones (Auburn University, Auburn, Ala.), and G E Cook. In *Sharing the sun Solar technology in the seventies, Proceedings of the Joint Conference*, Winnipeg, Canada, August 15-20, 1976 Volume 8. Cape Canaveral, Fla., International Solar Energy Society, 1976, p 238-244 6 refs. Research supported by the U S Department of the Interior, Alabama Power Co., and ERDA.

**A77-49113 An immiscible fluid - Heat of fusion energy storage system** D D Edie and S S Melshimer (Clemson University, Clemson, S C.) In *Sharing the sun Solar technology in the seventies, Proceedings of the Joint Conference*, Winnipeg, Canada, August 15-20, 1976 Volume 8. Cape Canaveral, Fla., International Solar Energy Society, 1976, p 262-272 14 refs.

Preliminary studies of a novel heat of fusion energy storage system have been conducted. This system uses direct contact heat transfer between an aqueous crystallizing solution and an immiscible heat transfer fluid. The phase change solution is permanently contained in an insulated storage tank. A heat transfer fluid (which is immiscible in the phase change solution) is circulated through the solution and transfers heat either to or from the solution. By eliminating permanent heat exchange surfaces, this immiscible fluid system avoids the phase stratification problem which has negated the potential storage efficiency of many previous heat of fusion systems. The target energy density for this heat storage system design is 3.5 x 10 to the eighth joules per cubic meter. The estimated cost for storage of 10 x 10 to the ninth joules is \$1,100. (Author)

**A77-49114 Reinforced pillow solar water heater** R R Davison and W B Harris (Texas A & M University, College Station, Tex.) In *Sharing the sun Solar technology in the seventies, Proceedings of the Joint Conference*, Winnipeg, Canada, August 15-20, 1976 Volume 8. Cape Canaveral, Fla., International Solar Energy Society, 1976, p 366-371

The pillow solar water heater is formed by confining a flexible bag between supporting elements to give it strength to withstand pressure. This narrows the flow channels resulting in a number of advantages. Fabrication details and some performance data are given with some discussion of economic factors and probable applications. (Author)

**A77-49115 Payback of solar systems** K W Boer (Delaware, University, SES, Inc., Newark, Del.) In *Sharing the sun Solar technology in the seventies, Proceedings of the Joint Conference*, Winnipeg, Canada, August 15-20, 1976 Volume 9

Cape Canaveral, Fla., International Solar Energy Society, 1976, p 1-17 11 refs. Research sponsored by SES, Inc.

A variety of solar conversion systems is studied in a dynamic economical model in which the real cost of energy inflates Payback times and dates of probable market entries are estimated. A distributed system to convert solar energy into heat and electricity in direct proximity to the consumer (Solar One System) is economically attractive even for solar cells with well below 10% conversion efficiency when these can be installed in flat plate collectors for less than twenty dollars per square meter, in addition to the collector cost. (Author)

**A77-49116 Solar system market capture in the climato-economic regions of the United States** W H McCumber, Jr (IBM Corp., Federal Systems Div., Huntsville, Ala.) In *Sharing the sun Solar technology in the seventies, Proceedings of the Joint Conference*, Winnipeg, Canada, August 15-20, 1976 Volume 9

Cape Canaveral, Fla., International Solar Energy Society, 1976, p 18-31 6 refs.

Penetration of solar energy systems into construction markets is determined by the economic expectations of the consumer. Since individual customization is impractical, regions of similar economic and climatological characteristics may be defined against which to optimize designs. This paper defines 51 climato-economic regions of the US and demonstrates two computerized analytical tools, CERES (Comprehensive Economic Recovery Evaluation System) and CAP (Capture Analysis Program), which extrapolate the technical and economic performance of region-optimal systems into national market capture expectations. Used iteratively, CERES and CAP evaluate the sensitivity of market capture to incremental changes in technical characteristics or economic environment. (Author)

**A77-49117 The feasibility of solar house heating - A study in applied economics** A Shams and R Fichtenbaum (Washington University, St Louis, Mo.) In *Sharing the sun Solar technology in the seventies, Proceedings of the Joint Conference*, Winnipeg, Canada, August 15-20, 1976 Volume 9. Cape Canaveral, Fla., International Solar Energy Society, 1976, p 32-50 6 refs.

The economic feasibility of solar space heating for an average insulated single-family dwelling in St. Louis, Missouri is analyzed. Factors relating to climate, the heat loss coefficient of residential structures, fuel costs and the capital costs of solar heating systems of various sizes were taken into account in establishing an optimal combination of solar and conventional forms of heating. A computer simulation was used to model systems of various capacities. The microeconomic technique of marginal analysis was employed in comparing capital costs of the solar heating plants with marginal savings resulting from the use of conventional fuels, the combination of solar and conventional heat which would minimize heating costs and conserve conventional fuels was determined. The role of government tax credits in providing incentives for the installation of high capacity solar units is also discussed. J M B

**A77-49118 A parametric study of critical fuel costs for solar heating in North America** J A Duffie, W A Beckman, and M J Brandemuehl (Wisconsin, University, Madison, Wis.) In *Sharing the sun Solar technology in the seventies, Proceedings of the Joint Conference*, Winnipeg, Canada, August 15-20, 1976 Volume 9. Cape Canaveral, Fla., International Solar Energy Society, 1976, p 51-63 5 refs. Contract No E(11-1)-2588

Critical fuel energy cost is defined as the cost of delivered energy from conventional sources below which heat from optimized solar systems is more expensive than heat from conventional sources. The critical fuel energy cost is a useful index to assess the feasibility of solar heating in any location or region. A method is presented for estimating the index value for particular locations, buildings, solar collectors, and solar heating system costs. Tables are given which

permit determination of critical fuel energy cost as a function of system costs for 96 stations in the United States and Canada. Examples of the determination are shown for two of these stations. (Author)

**A77-49119** Incentives and barriers to the development of solar energy. R H Bezdek and P D Maycock (ERDA, Div of Solar Energy, Washington, D C). In Sharing the sun. Solar technology in the seventies, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976. Volume 9. Cape Canaveral, Fla., International Solar Energy Society, 1976, p. 64-73.

Incentives and barriers to the widespread utilization of solar water and space heating, solar space cooling, agricultural and industrial process heat from solar energy, photovoltaic systems and solar space systems are discussed. High capital costs, restrictive zoning ordinances, controlled fossil fuel prices, and legal and regulatory restraints are cited as barriers to the introduction of the various types of solar energy systems, income tax credits, loan guarantees, interest subsidies, property and sales tax exemptions, investment tax credits, the integration of solar energy systems into utility networks and the dissemination of information are mentioned as factors promoting the use of solar energy. J M B

**A77-49120** Interfacing building design and solar energy research and standards. J K Holton (National Bureau of Standards, Center for Building Technology, Washington, D C). In Sharing the sun. Solar technology in the seventies, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976. Volume 9. Cape Canaveral, Fla., International Solar Energy Society, 1976, p. 74-82. 11 refs.

Research reports and standards developed in the field of solar energy by the US National Bureau of Standards are discussed. Technical evaluations, dealing with such topics as methods for rating liquid and air collectors and thermal storage units, thermal load simulation models, standards for solar energy system performance data, materials standards, and thermal performance of wood or masonry buildings, are listed. Draft standards and design guides, treating such subjects as site planning for solar energy utilization, or retrofitting a residence for solar heating and cooling, are also mentioned. In addition, associated studies, including economic analyses and a survey of solar energy legislation at the state level, are described. J M B

**A77-49121** Daedalophobia - Diagnosis and prognosis. H D Foster and W R D Sewell (Victoria, University, Victoria, British Columbia, Canada). In Sharing the sun. Solar technology in the seventies, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976. Volume 9. Cape Canaveral, Fla., International Solar Energy Society, 1976, p. 83-90. 11 refs.

Difficulties associated with the adoption of solar space heating systems in Canada are considered. The funding levels for government-sponsored research and development of solar heating systems in Canada are found to be inadequate, a lack of capital investment in the building materials industries is also noted. Nonuniform building codes in Canadian localities are cited as having a detrimental effect on the introduction of solar space heating systems. Dissemination of information on the cost and effectiveness of solar heating systems is discussed. J M B

**A77-49122** Assessment of the socio-economic and environmental aspects of the central receiver power plants. M Davidson, D Grether, and M Horowitz (California, University, Berkeley, Calif). In Sharing the sun. Solar technology in the seventies, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976. Volume 9. Cape Canaveral, Fla., International Solar Energy Society, 1976, p. 91-96. 11 refs. ERDA-supported research.

**A77-49123** Effect of solar home heating on electric utilities. H G Lorsch (Franklin Institute Research Laboratories, Philadelphia, Pa). In Sharing the sun. Solar technology in the

seventies, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976. Volume 9. Cape Canaveral, Fla., International Solar Energy Society, 1976, p. 97-112. 12 refs. NSF Grant No. C-1033.

The effect of introducing residential solar heating was modeled for two electric utilities in the Northeastern U.S., one experiencing a summer peak demand, the other a winter peak. For solar-heated homes with electric resistance back-up heating, the annual load factor is found to be approximately 40% lower than that of the conventionally heated residence. However, on the coldest day of the year, both types of heating system will place the same load demand on the utility. This identity of peak demand, together with the costs related to the installation of electrical facilities, may lower actual energy savings for the consumer using a combination of solar energy and conventional heating. Alternative rates that would reimburse the utilities for costs of integrating solar heating systems into power networks are considered. J M B

**A77-49124** Economic study of solar total energy. R W Harrigan (Sandia Laboratories, Albuquerque, N Mex). In Sharing the sun. Solar technology in the seventies, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976. Volume 9. Cape Canaveral, Fla., International Solar Energy Society, 1976, p. 113-127.

This paper investigates the application of solar total energy to a 2000-dwelling-unit mixed-load community. The community design is consistent with current community planning practices. An energy analysis of the community was performed, and a solar total energy system sized to meet the community demands. The economics of providing a solar total energy system is examined. The effect of dwelling-unit density is examined. (Author)

**A77-49126** Solar energy application considerations for housing in depressed communities. A E Smith, N Lior, S Z Klausner (Pennsylvania, University, Philadelphia, Pa), and S I Stanic. In Sharing the sun. Solar technology in the seventies, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976. Volume 9. Cape Canaveral, Fla., International Solar Energy Society, 1976, p. 137-154. 26 refs.

Some of the social and physical implications of possible government programs for subsidizing the application of solar heating technology for poor households and depressed communities. Existing and proposed government energy-related programs and legislation are evaluated for their effectiveness in relieving the impact of rising energy prices on household consumption patterns of the poor. Social, economic, technological, and architectural aspects of solar heating applications in depressed communities are considered. The conclusion reaffirms the systematic nature of housing, energy, and welfare problems. Some of the major recommendations include accelerating rehabilitation of the existing housing stock, demonstrating solar projects in depressed communities, and reducing welfare costs through government energy-related programs. (Author)

**A77-49127** Solar energy and urban settlements. R K Swartman (Western Ontario, University, London, Canada). In Sharing the sun. Solar technology in the seventies, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976. Volume 9. Cape Canaveral, Fla., International Solar Energy Society, 1976, p. 155-161.

This paper reviews the influence of energy on urban settlement patterns in the past. It then suggests possible patterns in the future as society turns towards solar energy as a major energy source. (Author)

**A77-49128** Technical and socio-economic aspects of solar energy and rural development in developing countries. R Ramakumar (Oklahoma State University, Stillwater, Okla). In Sharing the sun. Solar technology in the seventies, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976. Volume 9. Cape Canaveral, Fla., International Solar Energy Society, 1976, p. 162-176. 21 refs. NSF Grant No. AER 75 00647.

In developing countries, the losing race between demography and development is resulting in the emergence of the dual economy. Unless checked, this will lead to social and political tensions with global consequences. A healthy and dynamic rural growth is necessary to correct this situation. Energy can play a vital role in this process. A step-by-step approach is presented for the adoption of technologies designed to exploit renewable (solar) energy sources at the rural level. It is centered around the establishment of rural energy centers to improve the basic living environment. In due course, the role of these centers is to be expanded to encompass agricultural and small-scale industrial activities. The technical and socio-economic aspects of the step-by-step introduction of solar energy systems in rural areas in developing countries are discussed. (Author)

**A77-49129**      **Solar high technology and architecture** P. Tabb, A. Brown, and R. Hower (Joint Venture, Inc., Boulder, Colo.) In *Sharing the sun: Solar technology in the seventies*, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976. Volume 9. Cape Canaveral, Fla., International Solar Energy Society, 1976, p. 177-189.

The impact of solar mechanical systems upon multi-family housing in the Colorado region is described. Technical constraints encountered in the planning and architectural design phases, especially collector area intensiveness, are discussed. Four distinct multi-family housing forms matched with five generic solar mechanical systems are analyzed and illustrated. As an outgrowth of this analysis a student apartment building currently under construction was developed. This project, consisting of eight 4-bedroom units, has an area of 8,600 square feet. A Compound Parabolic Concentrating (CPC) Collector System delivers 74% of the annual space heating and domestic hot water demand. Due to the abundance of direct insolation in the Colorado area, the high efficiency of the solar mechanical system, and the energy responsive building design, a floor area-to-collector area ratio of 10:1 is achievable. (Author)

**A77-49130**      **Some institutional problems of residential solar heating** J. F. Blair, Jr. and J. O'Brien (Franklin Institute Research Laboratories, Philadelphia, Pa.) In *Sharing the sun: Solar technology in the seventies*, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976. Volume 9. Cape Canaveral, Fla., International Solar Energy Society, 1976, p. 190-199. 5 refs.

Because of the overwhelming influence of financial institutions on the building market, the paper puts forward the concept that governmental actions are required if solar-assisted heating systems are to become an acceptable technology in the near future. Barring radical changes, a large scale introduction of solar-assisted heating will not come about through economic forces alone. The key lies in subsidies which could be in the form of tax abatements to building owners, subsidies by utilities to building owners, preferential utility rates, and, most importantly, a credible and consistent energy policy on the part of the government. (Author)

**A77-49131**      **Economic and institutional rationale for solar retrofitting - Case example 'Project Sunshower'** D. W. Aitken, G. E. Guttormsen, W. T. Schooler, and C. Koland (San Jose State University, San Jose, California). In *Sharing the sun: Solar technology in the seventies*, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976. Volume 9. Cape Canaveral, Fla., International Solar Energy Society, 1976, p. 200-211.

It is suggested that universities and colleges begin immediately to apply solar energy design criteria and systems to their facilities. The experience at San Jose State University has demonstrated the growth of opportunities for further solar energy applications after an institutional commitment to begin the first major on-campus solar construction project had been made. It is also argued that lifetime cost analysis should be employed, but only in parallel to an appraisal of the benefits of solar systems in assuring reliability and continuity of institutional function during fuel shortages. San Jose State University's retrofit of three residence halls to a 9,000-square foot solar-assisted hot water system is utilized as an example. (Author)

**A77-49132**      **Report on United States international co-operation in solar energy technology development** L. O. Herwig and H. C. Yim (ERDA, Div. of Solar Energy, Washington, D.C.) In *Sharing the sun: Solar technology in the seventies*, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976. Volume 9. Cape Canaveral, Fla., International Solar Energy Society, 1976, p. 213-228.

The international cooperative exchange program administered by the Division of Solar Energy of ERDA are discussed. The chief areas of concern in the solar energy exchange programs, including thermal and solar electric applications, the conversion of biomass to fuels, and technological support and information services, are considered. Multilateral agreements arranged under the auspices of the International Energy Agency, including exchanges of information on solar heating, cooling and hot water system components, the mechanical testing of solar collectors, and measurements of solar radiation, are mentioned. Bilateral agreements with the U.S.S.R., Japan, France, and other nations, which have dealt with topics such as desalinization schemes, large-scale water heating plants and photovoltaic devices, are also reviewed. Cape Canaveral, Fla., International Solar Energy Society, 1976, p. 229-235.

The paper describes the design of a house which incorporates a solar heating system and other features to minimize energy require-

**A77-49134**      **User needs vs. technical demands, or the art of tradeoff in making a good, inexpensive solar home** N. Miley and R. Pierce. In *Sharing the sun: Solar technology in the seventies*, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976. Volume 9. Cape Canaveral, Fla., International Solar Energy Society, 1976, p. 236-250. 11 refs.

The design, construction and evaluation of an inexpensive single-family dwelling employing solar space heating in conjunction with conventional heating are discussed. The dwelling was designed for a climate having cold winters and hot summers, a Trombe-Micheal type solar collector was used to provide 70 to 90% of the winter heating requirements of the residence. Construction methods, particularly insulation practices, which emphasized reliance on inexpensive materials that could be assembled by relatively unskilled laborers, are also described. The initial cost of the 1150-square foot home was approximately \$15,500. J. M. B.

**A77-49136**      **The updated homesteader** T. Dean (Kansas University, Lawrence, Kan.) In *Sharing the sun: Solar technology in the seventies*, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976. Volume 9. Cape Canaveral, Fla., International Solar Energy Society, 1976, p. 257-261.

The paper describes the design and construction of a minimum energy dependent home for a middle-aged American couple whose environmental expectations are typical of many people. The utilization of solar and wind energy, together with gardening as a hobby, produced a host of related activities which effectively changed their lifestyle. Surprisingly, this unassuming and personal home has elicited widespread public attention. Primary energy for the home is provided by a 570 square foot roof-mounted flat plate collector, a 3.2 kw wind generator, and a wood-burning stove. (Author)

**A77-49137**      **Self sufficient energy integrated design and construction method for low cost self help housing programs** A. C. Clements (A. C. Clements and Associates, Engineers, Planners and Architects, San Juan, P.R.) and K. G. Soderstrom (Universidad de Puerto Rico, Mayaguez, P.R.) In *Sharing the sun: Solar technology in the seventies*, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976. Volume 9. Cape Canaveral, Fla., International Solar Energy Society, 1976, p. 262-275.

A method for the design and construction of low cost self-sufficient communities of permanent dwellings for subtropical and tropical countries is described. Particularly addressed are the locations where there are acute rehabilitation problems and a shortage of financial resources available for building and maintaining such communities. Using reinforced concrete as the prime material, the design integrates the benefits of solar energy, self-help labor concepts, and bio-gas waste disposal methods, the emphasis was on housing large numbers of people in a population where the average annual per capita income is five hundred dollars. The design, confirmed by computation of the viability of the structural and energy systems, also estimated the economic and social consequences, based on a study of local conditions of a far-eastern country (Author)

**A77-49138** Perceptual assessment of a new energy concept D Lorrman In Sharing the sun Solar technology in the seventies, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976 Volume 9 Cape Canaveral, Fla., International Solar Energy Society, 1976, p 276-281

The paper describes a preliminary evaluation of the perceptual impressions of the adaptation of a building design incorporating new energy concepts. Preliminary work of this nature is related to the Meadowvale Solar Experiment in Mississauga, Ontario. The comments are summarized and preliminary conclusions drawn in an attempt to gain a better insight into the task of integrating this new technology into a society set in well-established preconceptions (Author)

**A77-49139** Rural energy centre for Africa using solar, wind and biogas energies T A Lawand, R Alward, B Saulnier, H P Budgen, and E Brunet (McGill University, Ste Ann de Bellevue, Quebec, Canada) In Sharing the sun Solar technology in the seventies, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976 Volume 9 Cape Canaveral, Fla., International Solar Energy Society, 1976, p 282-309 Research supported by the United Nations

A rural energy center utilizing solar, wind and biogas energies in order to satisfy the basic energy needs, has been designed for a typical village in Senegal. The parameters of site selection, and the balance between the supply and demand for energies are discussed. In the center, energy will be supplied for water pumping and potabilization, cooking and some lighting. The energy required for cooking is about 80 percent of the total demand. All social, technical and economic factors have been considered in making the selection of equipment needed. The concept of an Appropriate Technology approach has been followed in undertaking the study (Author)

**A77-49140** The Crain solar house - A case study in the architectural and engineering design process as applied to solar housing for public sale H A Wade In Sharing the sun Solar technology in the seventies, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976 Volume 10 Cape Canaveral, Fla., International Solar Energy Society, 1976, p 8-17

**A77-49141** Report on the design, construction, and marketing of two solar heated SPEC houses C B Winn (Colorado State University, Solar Environmental Engineering Co., Inc., Fort Collins, Colo.) In Sharing the sun Solar technology in the seventies, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976 Volume 10 Cape Canaveral, Fla., International Solar Energy Society, 1976, p 18-34

The solar heating and cooling demonstration program of the Department of Housing and Urban Development (HUD), aimed at providing seed money for the design, installation, and marketing of solar systems in residential-type structures is reviewed. As a result of this program, two solar-heated houses have been built in and near Fort Collins, Colorado. One of the houses involves an air system whereas the other incorporates a water system. The air system will utilize the Solaron system while the water system makes use of

Reynolds Metals Company collectors. The water system also utilizes baseboard radiation for house heating in a manner which improves the performance of the solar system. Details of the design of the solar systems for both houses, together with a discussion of problems encountered during installation and suggestions for avoiding installation problems, are presented (Author)

**A77-49142** Commercialization of solar heating and cooling of buildings A C Johnson (Mitre Corp., McLean, Va.) In Sharing the sun Solar technology in the seventies, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976 Volume 10 Cape Canaveral, Fla., International Solar Energy Society, 1976, p 35-39

The use of Federal building programs and Federal agencies to promote solar heating and cooling as a viable option in construction programs is discussed. It is suggested that building codes and regulations be modified to encourage introduction of solar energy systems, development of credible cost and performance data for the hardware involved is also urged. An analysis of dislocations in the construction industry which may be caused by the widespread adoption of solar heating and cooling is proposed. In addition, benefits of increased use of solar energy systems, including reduction of U.S. dependence on imported fuels and improvements in environmental conditions, are cited J M B.

**A77-49143** Design factors for a cost effective solar collection system C H Holtyn, D J Laudig, and T W Schmidt (Reynolds Metals Co., Richmond, Va.) In Sharing the sun Solar technology in the seventies, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976 Volume 10 Cape Canaveral, Fla., International Solar Energy Society, 1976, p 40-45

The design of solar collecting systems which are inexpensive and can be installed and maintained economically is discussed. Use of water treatment to prolong the life of hydronic solar energy systems, reliance on similar construction materials to reduce galvanic corrosion, and adoption of closed-loop systems employing heat exchangers are suggested as means for developing cost-effective solar collecting systems. The effect of prefabrication of supports and tubing for solar collectors is also assessed, a sample problem involving computation of the cost per square foot for installation of a system of ten collectors, together with tubing and supports, is given J M B.

**A77-49144** Minimum Energy Building - The first winter's operation D L McClenahan and H P Misuriello (New York, State University, Albany, N.Y.) In Sharing the sun Solar technology in the seventies, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976 Volume 10 Cape Canaveral, Fla., International Solar Energy Society, 1976, p 79-89

Through a special grant from the New York State Legislature, a solar heated Minimum Energy Building was constructed at the Atmospheric Sciences Research Center, State University of New York at Albany. Design precedents, building construction and system operation are discussed. After evaluating the first winter's performance, it is concluded that the design concepts of monolithic structure, massive insulation, structural thermal storage and efficient solar collectors are valid and provide a method for implementing solar space heating in cold climates (Author)

**A77-49147** Solar air conditioning applications for warm humid climate T G Olsen (Miami, University, Coral Gables, Fla.) and R K Swartman (Western Ontario, University, London, Canada). In Sharing the sun Solar technology in the seventies, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976 Volume 10 Cape Canaveral, Fla., International Solar Energy Society, 1976, p 126-134

Air conditioning in warm humid climates presents certain difficulties as well as advantages associated with the given climatic conditions. Humidity control by conventional cooling methods depends upon the use of coil temperatures low enough to achieve the proper dew point temperature for the conditioned air. The solar-

driven absorption unit loses both capacity and performance when lower evaporation temperatures are required. In order to use absorption refrigeration more effectively in solar energy systems, it is desirable to perform latent removal by an auxiliary means. Liquid and dry desiccants provide a means of accomplishing this objective. Alternative methods of accomplishing separate latent heat removal may also be considered. (Author)

**A77-49148** The design of a solar cooling and heating system for a commercial building. W. O. Carter (Herman Blum, Consulting Engineers, Dallas, Tex.) In *Sharing the sun: Solar technology in the seventies*, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976. Volume 10. Cape Canaveral, Fla., International Solar Energy Society, 1976, p. 135-142.

A 320-ton solar cooling and heating unit designed to service a 90,000-square foot commercial building in Arizona is described. The cooling system utilizes a single lithium-bromide and water absorption refrigeration machine powered by hot water; refrigeration is distributed through a chilled water system. Factors taken into account in developing the unit included cooling of the interior light fixtures of the building, maintenance of an adequate ventilation air flow rate, and the integration of outside air cooling with adiabatic cooling. In addition, providing freeze protection for the collectors and a heat-release mechanism was considered. J. M. B.

**A77-49149** Dual Phase Annual Cycle for residential heating and cooling. D. Cerruti. In *Sharing the sun: Solar technology in the seventies*, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976. Volume 10. Cape Canaveral, Fla., International Solar Energy Society, 1976, p. 143-146.

The Dual Phase Annual Cycle (DPAC), a heating and cooling system using two thermal storage tanks (hot and cold), flat-plate solar collectors, and state-of-the-art hardware, is described. DPAC is compared to the Annual Cycle Energy System, developed by H. C. Fischer at Oak Ridge National Laboratory. Applications to the traditional single family dwelling and to an apartment complex are considered. Materials and methods of storage-tank construction are proposed. Some factors influencing the potential for commercial success are cited. (Author)

Cape Canaveral, Fla., International Solar Energy Society, 1976, p. 158-164. Research supported by the Stockton State College Foundation.

**A77-49152** Solar economics in Illinois. E. F. Barfield and A. J. Casella (Sangamon State University, Springfield, Ill.). In *Sharing the sun: Solar technology in the seventies*, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976. Volume 10. Cape Canaveral, Fla., International Solar Energy Society, 1976, p. 165-170. 8 refs.

Operating costs for houses utilizing conventional fuels for heating, hot water, and/or cooling are compared with those for identical houses that utilize solar energy for the same purposes. Three different sized houses were considered at six different locations in Illinois. Solar insolation data was gathered or calculated for each location. Heating, hot water, and/or cooling load were calculated for each house along with system performance utilizing five different sized solar systems. Yearly operating costs for the solar equipped houses were calculated based upon a 20-year life cycle, 8% interest rate, and collector costs of \$8, \$10, or \$12 per square foot. (Author)

**A77-49153** Thermal energy storage and transportation. V. J. Sevcik (Argonne National Laboratory, Argonne, Ill.). In *Sharing the sun: Solar technology in the seventies*, Proceedings of the Joint

Conference, Winnipeg, Canada, August 15-20, 1976. Volume 10. Cape Canaveral, Fla., International Solar Energy Society, 1976, p. 177-182. 13 refs. ERDA-sponsored research.

The application of thermal energy storage concepts to the design of an automobile propulsion system capable of competing with that of electric vehicles is discussed. The proposed vehicle would utilize a thermal storage source, such as a molten salt heat battery, to power a thermal engine. Various materials, including lithium fluoride, sodium chloride, or silicon are considered as candidates for use in the heat batteries; thermal engines based on the Brayton, Rankine, or Stirling cycle are also assessed. It is concluded that a lithium-fluoride battery used in conjunction with a Stirling engine may be the best prospect for development. The reliability, safety and simplicity of the proposed vehicle are analyzed. J. M. B.

**A77-49154** Design, operation and economics of the Energy Plantation. M. D. Fraser, J. F. Henry, and C. W. Vail (InterTechnology Corp., Warrenton, Va.). In *Sharing the sun: Solar technology in the seventies*, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976. Volume 10. Cape Canaveral, Fla., International Solar Energy Society, 1976, p. 188-193. 5 refs. Research supported by the American Gas Association, Grant No. DACA23-74-C-009.

An Energy Plantation is a means for producing fuels by collecting and storing solar radiation in plants grown purposely for their fuel value. Appropriate selection of plant species and plantation cultural practices is the key to producing fuels by this means at attractive cost. This paper discusses how the Energy Plantation is designed and operated for maximum productivity of plant material. The cost of the fuel produced is estimated to be less than \$1.20 per million BTU of useful heating value. (Author)

**A77-49155** Residential application of photovoltaic energy systems. E. F. Federmann, P. F. Pittman, S. Nearhoof, and P. R. Rittelmann (Westinghouse Electric Corp., Pittsburgh, Pa.). In *Sharing the sun: Solar technology in the seventies*, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976. Volume 10. Cape Canaveral, Fla., International Solar Energy Society, 1976, p. 206-211.

The prospect of reduced cost photovoltaic material creates a potential for on-site systems that can provide the bulk of residential electrical and thermal requirements. The likelihood of increased energy costs combined with increased system use with time should assure economic viability in virtually all regions of the United States in about twenty years. The sizing, economic viability, and performance of various photovoltaic systems were determined for seven geographical regions on a study just completed for ERDA. Of these, one of the Atlanta, Ga. type residences was chosen for this discussion. A specific system and function is specified, as well as all necessary subsystems. (Author)

**A77-49156** On the analysis and design of grid structures for p-n junction solar cells. J. L. Boone and T. P. Van Doren (Missouri-Rolla, University, Rolla, Mo.). In *Sharing the sun: Solar technology in the seventies*, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976. Volume 10. Cape Canaveral, Fla., International Solar Energy Society, 1976, p. 212-217. 5 refs.

A one-dimensional distributed diode model for the p-n junction solar cells is utilized to develop analytical expressions for solar cell V-I characteristics as a function of short circuit current, sheet resistance, grid spacing, thermal voltage and open circuit voltage. Experimental results are given to show that these expressions may be utilized to determine the effects of sheet resistance, grid spacing and sunlight intensity upon the solar cell output. The relation of the parameters to the fill factor is also discussed. Results indicate the p-n junction parameters will dictate the maximum grid spacing for given light intensity but the minimum spacing is still controlled by the metal contacting techniques. (Author)

**A77-49157** Solar heating and cooling computer analysis - A simplified sizing design method for non-thermal specialists. M.

Connolly, R. Giellis, C. Jensen, and R. McMordie (Martin Marietta Aerospace, Denver, Colo.) In *Sharing the Sun Solar Technology in the Seventies*, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976. Volume 10. Cape Canaveral, Fla., International Solar Energy Society, 1976, p. 220-234. 5 refs. Contract No. E(11-1)-2876.

Emphasis on solar energy for use in space heating and cooling presents a problem for many architects, heating, ventilating and air conditioning engineers, and contractors because they lack expertise in solar applications. This paper describes two public-domain computer design programs, written for use by the solar community SOLCOST, a simplified sizing design method for nonthermal specialist users, computes an optimum collector area and tilt angle from a life cycle cost analysis. SOLCOST computes heating or cooling loads using a thermal network method. Data banks in SOLCOST provide the user with parameters needed for the solar and life cycle cost analyses. Collector performance is modeled using the percent of possible sunshine measurement. A simulation program, SOLSIM, has also been developed using thermal network methods. SOLSIM input decks are available for five typical solar systems. The solar analysis and life cycle cost methodology are presented, along with descriptive sample problems. (Author)

**A77-49158** Georgia Tech 400 KWth solar thermal test facility. J. D. Walton, Jr., S. H. Bomar, Jr., and N. E. Poulos (Georgia Institute of Technology, Atlanta, Ga.) In *Sharing the Sun Solar Technology in the Seventies*, Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976. Volume 10. Cape Canaveral, Fla., International Solar Energy Society, 1976, p. 245-258, 6 refs.

Under ERDA sponsorship Georgia Tech is constructing a 400 KWth solar test facility for high temperature solar energy research and development. The Georgia Tech facility utilizes 550 round mirrors 111 centimeters in diameter which may be operated flat or focused to provide radiant heat fluxes from 25 to 200 W/sq cm to a test area centrally located above the mirror field. Scheduled to be completed in January 1977, it will be used first to heat a boiler-superheater to deliver 365 Kg/hr of steam at 150 atmospheres and 600 C. Other uses include evaluation of experimental receivers utilizing such heat transfer fluids as steam, air, helium, oil, molten salts and liquid metals, and basic research in the areas of metals, ceramics and coatings. (Author)

**A77-49160 \* #** Fundamental studies of black chrome for solar collector use. G. McDonald, B. Buzek, and H. Curtis (NASA, Lewis Research Center, Cleveland, Ohio). *International Solar Energy Society and Solar Energy Society of Canada, Joint Conference on Sharing the Sun Solar Technology in the Seventies*, Winnipeg, Canada, Aug. 15-20, 1976, Paper 4 p.

The thicknesses of black chrome plated for various times have been measured from electron photomicrographs and correlated with the solar spectrum absorptance and infrared emittance as calculated from spectral reflectance measurements. The maximum absorptance is reached at an average thickness of 0.5 micrometer. The emittance increases only slightly up to 1.0 micrometer but increases rapidly at thickness above 1.0 micrometer. (Author)

**A77-49161 \* #** Evaluation of flat-plate collector efficiency under controlled conditions in a solar simulator. S. M. Johnson and F. F. Simon (NASA, Lewis Research Center, Cleveland, Ohio). *International Solar Energy Society and Solar Energy Society of Canada, Joint Conference on Sharing the Sun Solar Technology in the Seventies*, Winnipeg, Canada, Aug. 15-20, 1976, Paper 19 p. 9 refs.

The measured thermal efficiencies of 35 collectors tested with a solar simulator, along with the correlation equations used to generalize the data, are presented in this report. The single correlation used is shown to apply to all the different types of collectors tested, including one with black paint and one cover, one with a selective surface coating and two covers, and an evacuated-tube collector. The test and correlation technique is also modified by using a shield so that collectors larger than the simulator test area can

also be tested. This technique was verified experimentally for a shielded collector for which the collector shielded area was 31% of the solar simulator radiation area. A table lists all the collectors tested, the collector areas, and the experimental constants used to correlate the data for each collector. (Author)

**A77-49162 \* #** Performance correlations of five solar collectors tested simultaneously outdoors. D. R. Miller (NASA, Lewis Research Center, Cleveland, Ohio). *International Solar Energy Society and Solar Energy Society of Canada, Joint Conference on Sharing the Sun Solar Technology in the Seventies*, Winnipeg, Canada, Aug. 15-20, 1976, Paper 26 p.

Collector thermal efficiency, and efficiency degradation with time were measured for 5 flat-plate solar collectors tested simultaneously in an outdoor solar collector test facility. Results indicate that by using collector performance parameters which account for diffuse insolation, outdoor data recorded on 'cloudy' days can be used as a measure of performance, as long as the ratio of direct to total insolation exceeds approximately 0.6. These outdoor results also show good agreement with thermal efficiency data obtained indoors in a solar simulator. Significant efficiency degradation occurred on only one of the five collectors exposed to outdoor conditions for a period of one to two years. (Author)

**A77-49163 \* #** An experimental investigation with artificial sunlight of a solar hot-water heater. F. F. Simon (NASA, Lewis Research Center, Cleveland, Ohio). *International Solar Energy Society and Solar Energy Society of Canada, Joint Conference on Sharing the Sun Solar Technology in the Seventies*, Winnipeg, Canada, Aug. 15-20, 1976, Paper 19 p. 8 refs.

Thermal performance measurements were made of a commercial solar hot-water heater in a solar simulator. The objective of the test was to determine basic performance characteristics of a traditional type of flat-plate collector, with and without side reflectors (to increase the solar flux). Due to the fact that collector testing in the solar simulator permits control of the variables that affect collector performance, it was possible to obtain information on each of the following: (1) the effect of flow and incidence angle on the efficiency of a flat-plate collector (but only without side reflectors), (2) transient performance under flow and nonflow conditions, (3) the effectiveness of reflectors in increasing collector efficiency for a zero radiation angle at fluid temperatures required for solar air conditioning, and (4) the limits of applicability of a collector efficiency correlation based on the Hottel-Whillier equation (1958). **A77-49164 \* #** Initial operation of a solar heating and cooling system in a full-scale solar building test facility. R. H. Knoll, D. Miao (NASA, Lewis Research Center, Cleveland, Ohio), I. L. Hamlet, and R. N. Jensen (NASA, Langley Research Center, Hampton, Va.). *International Solar Energy Society and Solar Energy Society of Canada, Joint Conference on Sharing the Sun Solar Technology in the Seventies*, Winnipeg, Canada, Aug. 15-20, 1976, Paper 17 p.

The Solar Building Test Facility (SBTF) located at Hampton, Virginia became operational in early summer of 1976. This facility is a joint effort by NASA-Lewis and NASA-Langley to advance the technology for heating and cooling of office buildings with solar energy. Its purposes are to: (1) test system components which include high-performing collectors, (2) test performance of complete solar heating and cooling system, (3) investigate component interactions and (4) investigate durability, maintenance and reliability of components. The SBTF consists of a 50,000 square foot office building modified to accept solar heated water for operation of an absorption air conditioner and for the baseboard heating system. A 12,666 square foot solar collector field with a 30,000 gallon storage tank provides the solar heated water. A description of the system and the collectors selected is given here, along with the objectives, test approach, expected system performance and some preliminary results. (Author)

**A77-49165 \* #** Measured performance of a 3-ton LiBr absorption water chiller and its effect on cooling system operation. D.

Namkoong (NASA, Lewis Research Center, Cleveland, Ohio) *International Solar Energy Society and Solar Energy Society of Canada, Joint Conference on Sharing the Sun Solar Technology in the Seventies, Winnipeg, Canada, Aug 15-20, 1976, Paper 10 p 8 refs*

A 3-ton lithium bromide absorption water chiller was tested for a number of conditions involving hot-water input, chilled water, and the cooling water. The primary influences on chiller capacity were the hot water inlet temperature and the cooling water inlet temperature. One combination of these two parameters extended the output to as much as 125% of design capacity, but no combination could lower the capacity to below 60% of design. A cooling system was conceptually designed so that it could provide several modes of operation. Such flexibility is needed for any solar cooling system to be able to accommodate the varying solar energy collection and the varying building demand. It is concluded that a 3-ton absorption water chiller with the kind of performance that was measured can be incorporated into a cooling system such as that proposed, to provide efficient cooling over the specified ranges of operating conditions.

**A77-49166** **Solar energy conversion with fluorescent collectors.** A. Goetzberger and W. Greubel (Fraunhofer-Gesellschaft zur Förderung der angewandten Forschung, Institut für angewandte Festkörperphysik, Freiburg im Breisgau, West Germany). *Applied Physics*, vol. 14, Oct. 1977, p. 123-139. 23 refs.

A new principle for solar energy conversion is proposed and evaluated theoretically. Collection and concentration of direct and diffuse radiation is possible by the use of a stack of transparent sheets of material doped with fluorescent dyes. High efficiency of light collection can be achieved by light guiding and special design of collectors. The optical path length in a triangular collector is computed. In combination with solar cells this type of collector offers the advantage of separating the various fractions of light and converting them with solar cells with different bandgaps. Theoretical conversion efficiency under optimum conditions is 32% for a system with four semiconductors. An estimate of the economics of electricity generation shows that due to the concentration costs can be much lower than possible today. With the use of only silicon cells the breakeven point of \$0.5/W is almost reached. Practical difficulties to be solved are: Synthesis of dyes with stringent requirements, identification of plastic materials with high transparency and development of solar cells with higher bandgaps.

**A77-49249** **Anik B, the new Canadian domestic satellite.** R. W. Hoedemaker (RCA, Astro Electronics Div., Princeton, N.J.) and D. G. Thorpe (Telesat Canada, Ottawa, Canada). *RCA Engineers*, vol. 23, June-July 1977, p. 80-84.

Data and descriptions are provided for the communications system and physical spacecraft layout and performance of the Anik B Canadian communications satellite. Anik B will be a dual-band satellite with two independent transponder subsystems, one operating in the 6/4-GHz bands, the other in the 14/12-GHz bands. Point-to-point voice, video, and data communications traffic between Canada's ten provinces and two territories will be facilitated by the satellite, which is a modification of the RCA Satcom system. Solar cells of greater efficiency and greater battery capability are expected to produce 140 W RF power throughout a 7-yr design life, including eclipse periods. TWTAs, coverage patterns, and multiplexers are described.

**A77-49348** **An off-peak energy storage concept for electric utilities. I - Electric utility requirements.** V. T. Sulzberger, Y. Z. El-Badry (Public Service Electric and Gas Co., Newark, N.J.), J. E. Clifford, and E. W. Brooman (Battelle Columbus Laboratories, Columbus, Ohio). *Applied Energy*, vol. 3, July 1977, p. 167-188. 24 refs. Research supported by the Battelle Columbus Laboratories.

A water battery was evaluated in an analytical and conceptual design study as a load-leveling system for an electric utility. The water battery produced hydrogen and oxygen by electrolysis of water during periods when off-peak electrical power was available. During peak demand periods, the water battery, operating in the reverse mode, functioned as a fuel cell by producing electrical power

through the recombination of the oxygen and hydrogen held in its storage vessels. Factors considered in the analysis include present and future energy requirements, current off-peak energy availability, typical sizing and placement of energy storage units, and the approximate break-even economics and potential advantages to the utility of a water battery energy storage system. In the cost effectiveness analysis, the water battery was compared with gas turbines and fuel cells.

**A77-49349** **Ocean wave power.** I. Glendenning (Central Electricity Generating Board, Marchwood Engineering Laboratories, Southampton, England). *Applied Energy*, vol. 3, July 1977, p. 197-222. 31 refs.

The potential of wave power and some of the more promising methods of harnessing it are discussed with attention to the wave energy arriving on the west coast of the United Kingdom. Unresolved technical and engineering problems are examined, and the impact of wave power on the environment is considered. Data on wave power and its variability are supplied. It is suggested that wave power could be exploited to conserve fossil fuels but is unlikely to be competitive with nuclear power.

**A77-49400** **Extraterrestrial resources and astronautics (Vnesheie resursy i kosmonavtika).** V. P. Burdakov and I. I. Danilov (Moscow, Atomizdat, 1976). 552 p. 853 refs. In Russian.

Papers are presented discussing the use of extraterrestrial materials and energy for powering spacecraft thrust equipment. Described are the thermodynamic parameters of earth, Mars, and Venus, earth's magnetic field and that of interplanetary space, and solar electromagnetic radiation. Various types of onboard storage cells are presented, along with onboard collectors of extraterrestrial resources. A classification scheme for energy converters is outlined, with attention to thermal and electromagnetic converters. Methods of creating thrust are reviewed as are analytical procedures for evaluating the effectiveness of spacecraft thrust systems.

**A77-49494** **MIS silicon solar cells with In2O3 anti-reflective coating.** H. Matsunami, S. Matsumoto, and T. Tanaka (Kyoto University, Kyoto, Japan). *Japanese Journal of Applied Physics*, vol. 16, Aug. 1977, p. 1491, 1492. 7 refs.

The electrical and optical properties of a solar cell with an In2O3-Pt-SiO2-nSi layered structure are studied. Experiments show that the open-circuit voltage of Pt-SiO2-nSi solar cells is increased by optimizing the thickness of the insulating layer. The short-circuit current and fill factor are also increased by an antireflective coating with transparent conductive In2O3 films. This solar cell has an efficiency of 8.8%, which represents a 127% increase. It is suggested that refinement of the formation of the insulating layer and the use of digitated electrodes will lead to an even higher efficiency.

**A77-49575** **Prospecting for geothermal energy by geophysical methods.** R. Haenel (Niedersächsisches Landesamt für Bodenforschung, Hanover, West Germany). *Physics in Technology*, vol. 8, Sept. 1977, p. 213-218.

An assessment of methods used in prospecting for geothermal energy is presented. Three sources of geothermal deposits are identified: (1) areas of recent volcanism, (2) sediment basins, and (3) hot dry rock areas. After initial mapping of permeable and impermeable zones, any one of several techniques may be applied for a more thorough investigation of the subsurface. Descriptions of the following methods are included: aerial infrared surveys, geoelectrical investigation, geothermal measurements, explosion seismics, micro-earthquakes and ground-noise surveys, gravity studies, and airborne magnetic survey and geomagnetics. Data thus obtained may be used to construct a model of the subsurface and its thermal features, and economic studies can determine optimum sites for deep production wells.

Cron (Union Oil Research Center, Brea, Calif.) *Geothermal Energy*, vol 5, Sept. 1977, p. 8, 9, 11-19 (17 ff.) 35 refs.

The chemical composition of geothermal steam at a New Mexico site is investigated with attention to its effect on the corrosion, stress-corrosion cracking, and fatigue endurance limits of turbine and heat exchanger materials. The test procedure is described with regard to equipment and materials, and evaluations of turbine and heat exchanger alloys. Conclusions based on field test programs and turbine experience with other nongeothermal contaminated atmospheres are presented. SCS

**A77-49745 # Georgia Tech high temperature solar test facility.** J D Walton, Jr (Georgia Institute of Technology, Atlanta, Ga.) In Symposium on Electromagnetic Windows, 13th, Atlanta, Ga., September 21-23, 1976, Proceedings Atlanta, Ga., Georgia Institute of Technology, 1977, p. 133-138 8 refs ERDA-sponsored research

The Georgia Institute of Technology Solar Thermal Test Facility, which involves a 400-kW solar furnace suitable for simulating aerodynamic heating of radomes, is described. Plans for the facility, scheduled to begin preliminary operation in 1977, call for an initial array of 550 circular mirrors made of low-iron window glass. Mechanical drive mounts for directing the concentrated solar energy to various test areas are also included in the planning. Calculations indicate that with maximum heat flux and concentration ratios, the solar furnace could provide a test area in which at least 175 kW of radiant thermal energy is available. Additional documentation of the facility is also mentioned. JMB

**A77-49753 International Conference on Thermoelectric Energy Conversion, University of Texas, Arlington, Tex., September 1-3, 1976, Proceedings** Conference sponsored by the Institute of Electrical and Electronics Engineers. Edited by K R Rao (Texas, University, Arlington, Tex.). New York, Institute of Electrical and Electronics Engineers, Inc., 1976 192 p. Members, \$15, non-members, \$20

The papers deal with radioisotope thermoelectric generators (RTGs), thermoelectric (TE) materials and their properties, TE coolers, TE generators, novel TE devices, and TE heat-pump systems. Topics include recent terrestrial and undersea applications of RTGs, thermal optimization of small Pu-238-fueled RTGs, thermoelectric properties of Group I chalcogenides, quenching of thermoelectric Ge-Si alloys, a computer-aided design for a TE heat exchanger, and a numerical analysis of the transient behavior of TE coolers. Optimization of a TE generator design for fixed heat-input operation is also examined along with power-generating thermojunctions with radial current flow in coaxial disks, performance characteristics of a sodium heat engine, the overall efficiency of a solar collector that uses a Fresnel lens and a TE module to generate electrical power, an application of TE coolers as blackbody reference sources, and techniques for estimating heat loads on TE coolers. FGM

**A77-49988 # Investigation of the effective heat conductivity of metal-fiber wicks for low-temperature heat pipes (Issledovanie effektivnoi teploprovodnosti metallovoloknistykh fitilei nizko-temperaturnykh teplovykh trub)** M. G. Seniena and V. K. Zaripov (Kievskii Politehnicheskii Institut, Kiev, Ukrainian SSR). *Inzhenero-Fizicheskii Zhurnal*, vol. 33, Aug 1977, p. 255-262 16 refs. In Russian.

The experiments described were carried out to study the effective heat conductivity of wicks prepared from sintered copper, nickel, Nichrome, and stainless-steel fibers impregnated with methyl and ethyl alcohol, acetone, and distilled water. The monodisperse discrete fibers measured 20, 30, 40, 50, and 70 microns in diameter. The porosity of the wicks ranged from 10 to 96%. Test temperatures were between 16 and 35 C. The influence of such factors as porosity, fiber diameter, contact thermal resistance, and the heat conductivity of the liquids and fiber materials on the effective heat conductivity of the wicks was investigated. The heat transfer coefficients in the condensation zones of several low-temperature heat pipes employing metal-fiber wicks are calculated. V.P.

**A77-50050 Model calculations for metal-insulator-semiconductor solar cells** L C Olsen (Joint Center for Graduate Study, Richland, Wash.) *Solid-State Electronics*, vol 20, Sept 1977, p. 741-751 15 refs NSF Grants No AER-75-20501, No ENG-74-20444

An analytical approach to the calculation of MIS solar cell performance is developed. A model is constructed which accounts for three possible situations for the interface states in a MIS cell under illumination: (1) the interface states are in equilibrium with the metal, (2) they are in equilibrium with the majority carriers, or (3) they are in equilibrium with the minority carriers. It is assumed that the charged impurity concentration in the semiconductor is less than around 10 to the 18th power per cu cm. The interfacial region is assumed to be charge-free. The general conclusion is that the addition of an insulating layer between the metal and the semiconductor enhances the power conversion efficiency. PTH

**A77-50199 Thermal efficiency of solid electrolyte fuel cells with mixed conduction.** P N Ross, Jr and T. G. Benjamin (United Technologies Corp., Power Systems Div., South Windsor, Conn.) *Journal of Power Sources*, vol 1, Sept 1977, p. 311-321 16 refs. Research supported by the Electric Power Research Institute

The effect of mixed anionic and n-type electronic conduction in solid electrolytes on the thermal efficiency of a fuel cell system was analyzed quantitatively. The mixed conduction observed when electrolytes based on ceria are used in H<sub>2</sub>/air fuel cell applications lowers the maximum attainable cell thermal efficiency to below 40%. Neither the zirconia nor the ceria based solid oxide electrolytes studied to date can be used in a low temperature (700 C) system that meets simultaneously the requirements of power density and thermal efficiency for electric utility power plants. The material properties required for an advanced fuel cell power plant solid electrolyte were derived in terms of the ionic conductivity and the Schmalzried parameters. (Author)

**A77-50200 Simplex optimization of carbon electrodes for the hydrogen oxygen membrane fuel cell.** J Ceynowa and R Wodzki (Torun, Uniwersytet, Torun, Poland) *Journal of Power Sources*, vol 1, Sept 1977, p. 323-331 20 refs

**A77-50201 Natural convection phenomena in inclined cells with finite side-walls - A numerical solution** W Koutsoheras and W W S Charters (Melbourne, University, Melbourne, Australia) (*International Solar Energy Society, International Solar Energy Congress and Exposition, Los Angeles, Calif., July 28-Aug 1, 1975*) *Solar Energy*, vol 19, no 5, 1977, p. 433-438 5 refs

The effects of Rayleigh number, aspect ratio, and angle of inclination on the heat transfer through an inclined air cell are studied via the numerical solution of the relevant two-dimensional governing equations. This is done for two side-wall boundary conditions, namely, that of perfectly insulating and infinitely conducting side walls. In addition, the effects of a finite-thickness wall with a finite value of thermal conductivity is studied by solving the two-dimensional conduction equation in the wall and matching the values of temperature and heat flux at the common boundaries between the two regions. It is shown that the perfectly insulating and infinitely conducting boundary conditions are the two extremes of the real case and, depending on the values of the fluid parameters and the value of the wall thermal conductivity, the two fixed boundary conditions can be either accurate or inaccurate representations of the real case. A discussion of the relevance of this work to solar absorbers is included, with the major conclusion being that, depending on the aspect ratio of the cell used, cellular structures can be effective in reducing convective losses in inclined absorbers. (Author)

**A77-50202 On power-generating thermojunctions with radial flow of current** K Landecker (New England, University, Armidale, New South Wales, Australia) *Solar Energy*, vol 19, no. 5, 1977, p. 439-443. Research supported by the Australian Research Grants Committee

It was shown in a previous publication that in refrigerating thermocouples whose arms are in the form of coaxially arranged thermoelectric disks in which the current flow is radial, the effect of Joule heating on the performance is considerably reduced if the outer and inner radii of the disks are in the ratio of 4.5. It is now shown that if the same couples are used for the generation of power, the performance is enhanced in such a way that the internal resistance appears to be greatly reduced in magnitude. It is again found that disks with lateral boundaries in the form of hyperboloids have the most favorable shape. The thermojunctions described have been used mainly for research into utilization of solar energy.

**A77-50203 \*** Hydrogen quantum yields in the 360 nm photolysis of  $\text{Eu}^{2+}$  solutions and their relationship to photochemical fuel formation. P. R. Ryason (California Institute of Technology, Jet Propulsion Laboratory, Pasadena, Calif.) *Solar Energy*, vol 19, no 5, 1977, p 445-448. 16 refs. Contract No. NAS7-100.

Water decomposition by a cyclic photoredox process is discussed in general terms. Thermodynamics determines the wavelength of the charge-transfer band corresponding to electron transfer to or from water of hydration of a cation. These relationships indicate that it is unlikely that a photoreduction reaction resulting in water decomposition will occur in the sea-level solar range of wavelengths. Such is not the case for photooxidation, and an example is known: the photolysis of  $\text{Eu}^{2+}$  in aqueous solution. Hydrogen quantum yields have been determined for this reaction. They are sufficiently high (about 0.3) as to offer encouragement for the further exploration of photoredox reactions as a means of solar energy conversion.

**A77-50205** Hydrogen production from water utilizing solar heat at high temperatures. T. Nakamura (Ministry of International Trade and Industry, Electrotechnical Laboratory, Tanashi, Tokyo, Japan) *Solar Energy*, vol 19, no 5, 1977, p 467-475. 12 refs.

Possibilities of producing hydrogen and oxygen from water utilizing solar heat at high temperatures are investigated. The process of direct thermal decomposition of water is studied using a conceptual model. It is shown that the thermodynamic requirements for the direct thermal decomposer are difficult to realize from the structural viewpoint and that existing separation methods are not applicable for such a decomposition process if it is to attain sufficiently high thermal efficiencies. Feasibilities of realizing simple two-step thermochemical decomposition processes are investigated based on existing thermochemical data. It is predicted, as the results of thermochemical as well as thermodynamic analyses, that a two-step thermochemical decomposition process using iron oxide operates efficiently at relatively low temperatures attainable with solar heat and compatible with structural materials.

**A77-50207** Heat transfer analysis of a flat-plate solar energy collector. G. Grossman, A. Shitzer, and Y. Zvirin (Technion - Israel Institute of Technology, Haifa, Israel) *Solar Energy*, vol 19, no 5, 1977, p 493-502. 13 refs.

A model is developed for the heat transfer in a flat-plate solar collector with a rectangular channel for water or air flow. This two-dimensional geometry offers the maximum area of contact between the fluid and the collecting surface exposed to the sun. The analysis yields temperature and heat-flow distributions in both dimensions of the collector. Thermal boundary layer development is

investigated. Overall efficiencies are calculated for uniform solar heat influx with variable heat losses from the plate. Thermosyphonic effect due to natural convection is evaluated, and the collector's geometry optimized with respect to this effect.

**A77-50208** The use of functionalized polymers as photosensitizers in an energy storage reaction. R. R. Hautala, J. Little, and E. Sweet (Georgia, University, Athens, Ga.) *Solar Energy*, vol 19, no 5, 1977, p 503-508. 15 refs. NSF Grant No. CHE-75-13752, Contract No. E(38-1)-893.

Insoluble polymer-bound photosensitizers, useful for the conversion of norbornadiene (1) to quadricyclene (2), have been synthesized. An acetophenone analog was produced by Friedel-Crafts acylation of polystyrene resin, while treatment of chloromethylated resin with salicylaldehyde and triethylamine produced an analog of benzyloxybenzaldehyde. Reaction of lithio-polystyrene resin with methyl 4-(N,N-dimethylamino)benzoate gave a ketone equivalent to 4-(N,N-dimethylamino)benzophenone (3). Quantum yields for the conversion of 1 and 2 using the polymer-bound sensitizers were generally comparable to, but slightly lower than, the analogous compound in homogeneous solution. The quantum yield of polymer-bound 3 was less solvent dependent than that of the homogeneous counterpart. The advantages of isolating the photosensitizer to the photochemical reactor stage of a photochemical solar energy storage device are discussed. Efficient sensitization by polymer-bound photosensitizers demonstrates the feasibility of this approach.

**A77-50209** A design procedure for solar air heating systems. S. A. Klein, W. A. Beckman, and J. A. Duffie (Wisconsin, University, Madison, Wis.) (*International Solar Energy Society, International Solar Energy Congress and Exposition, Los Angeles, Calif., July 28-Aug. 1, 1975*) *Solar Energy*, vol 19, no 5, 1977, p 509-512. 9 refs.

A solar air-heating system incorporating a flat-plate air heater and packed-bed thermal storage is described, and a simulation model for the system is developed. The results of many simulations of the air-heating system are used to establish the relationship between system performance and the system design and meteorological variables. The results are presented in analytic and graphical form, referred to as an f-chart for solar air-heating systems. The results of simulations in several widely different climates suggest that the information presented in the f-chart is location independent. Methods of estimating the performance of air-heating systems having a collector air capacitance rate and a storage capacity other than those used to generate the f-chart are included. A comparison of the performance of air- and liquid-based systems is afforded by a comparison of their respective f-charts. The air system is shown to perform better at high load fractions supplied by solar energy than a liquid-based system with the same collector thermal-performance parameters.

**A77-50212** The solar spectrum at typical clear weather days. K. W. Boer (Delaware, University, SES, Inc., Newark, Del.) *Solar Energy*, vol 19, no 5, 1977, p 525-538. 29 refs. Research supported by SES, Inc.

A number of typical clear-sky conditions are described which can be used for solar-collector calibration and general testing.

purposes. The spectral distribution of solar flux over the wavelength range from 300 to 1500 nm is given for the typical clear-weather days. Attention is focused on the air-mass-zero solar spectrum, effects of Rayleigh and Mie scattering, ozone and water-vapor absorption, and absorption due to other atmospheric molecules. Five model spectral distributions are presented which are reasonably close to the distribution of the direct solar component on certain clear-weather days. Scattered sky radiation is also taken into account along with solar irradiance at horizontal surfaces and the total irradiance on a surface normal to the direct solar component. F G M

**A77-50213**      **Solar energy and the residence - Some systems aspects** R C Neville (California, University, Santa Barbara, Calif.) *Solar Energy*, vol 19, no 5, 1977, p 539-548 16 refs

The feasibility, in an energy-flow sense, of providing heating, cooling, and electrical power for individual homes using some form of solar energy converter on the roof of each residence is considered. A model for home power requirements and solar insolation which reflects residence construction, local weather, and geographic location is developed. This is used to demonstrate that 50-90% of the homes in the USA could be self-powered from solar energy, provided sufficient insulation is used and adequate energy-conversion techniques are developed. A design program for creating cost-effective cylindrical parabolic reflectors for use in solar concentrating collectors is discussed. The program takes into account the geometry of the cylindrical mirrors in defining the maximum optical concentration obtainable with minimum usage of materials. Sample problems dealing with two kinds of thermal collector systems, one in which the primary cost is for the energy converter and a second in which the basic cost is relatively low, are given. Other factors affecting the design of a collector system, including the necessity for periodic adjustment of the mirror tilt, are also mentioned. J.M.B

**A77-50219**      **Influence of the direct spectral solar energy distribution on the normal total absorptivity of spectral selective surfaces** M van der Leij and C J Hoogendoorn (Delft, Technische Hogeschool, Delft, Netherlands) *Solar Energy*, vol 19, no 5, 1977, p 575-577 10 refs.

A commercially available solar simulator was used to study the effect of the direct spectral solar energy distribution on the normal total absorptivity of several spectral-selective surfaces. The surfaces analyzed included Co<sub>3</sub>O<sub>4</sub> on nickel, black chrome on nickel, oxidized copper and oxidized steel number 37. Reflectivities and emissivities for the spectral-selective surfaces, recorded under conditions of air mass number equal to two, were employed to compute normal total absorptivities; the computed data were compared to published standards. It was found that for practical engineering purposes the simple solar simulator, which has a continuous spectral curve, could provide an adequate model of the performance of the spectral-selective surfaces. **A77-50220**      **The dependence of current output of the Ti-TL SnO<sub>2</sub>/Pt iron-thionine photogalvanic cell on photostationary state composition** P D Wildes, K T Brown, M Z Hoffman, N N Lichtin (Boston, University, Boston, Mass.), and D E Hall (Exxon Research and Engineering Co., Linden, N.J.) *Solar Energy*, vol 19, no 5, 1977, p 579-582 24 refs NSF Grant No AER-72-03579

Photostationary state compositions of totally illuminated thin-layer iron-thionine solutions applicable to photogalvanic cells were determined for a number of illumination intensities. The photo-reduction of thionine in the illuminated solutions was measured spectrophotometrically by means of the cross-illumination technique. An alternate method of measurement involving calculations based on photochemical reaction equations is also considered. In addition, short-circuit currents in SnO<sub>2</sub>/Pt photogalvanic cells containing the iron-thionine solutions were monitored. A simple diffusion model is applied to account for the linear relationship between photostationary composition and the current output of the cells. It is concluded that a totally illuminated cell having an effective diffusion length of 25 microns and containing a specified concentration of leucothionine may convert solar light in the thionine band to electrical current with 100% efficiency. The components and performance of a focusing solar energy cylindrical collector system are described. The mirror is parabolic in cross section with a 50 mm focal distance and is 900 mm long. The absorbing pipe is made of copper and has a black oxidized surface which was lined with grooves to increase the absorption; the procedure for producing grooves is explained. A discontinuous tracking device was designed to detect the direction of the sun by means of a system of five phototransistors, two of high sensitivity and sharp directional characteristics, and three of low sensitivity and wide directional characteristics. The construction and circuitry of the tracking device are examined. The tracking device operates with an accuracy of 0.05 deg. Performance characteristics of the solar energy system are evaluated. **A77-50255**      **A technical scale gas generator for steam gasification of coal using nuclear heat** H Juntgen and K H. Van Heek (Bergbau-Forschung GmbH, Essen, West Germany) *Nuclear Technology*, vol. 35, Oct 1977, p 581-590 13 refs. Research supported by the Bundesministerium für Forschung und Technologie.

A fluidized bed coal gasifier into which the reaction heat is transferred from a gas-cooled high-temperature nuclear reactor (HTR) is described. New alloys based on Incoloy 800 will meet the specifications required for the heat exchanger. A technical scale gasifier will process about 50,000 kg of low volatile bituminous coal/h at 40 bar (4 MPa). Such HTR parameters as helium outlet and inlet temperatures, such coal parameters as ash and water content or reactivity, and other parameters exert an impact on operating data of a combined plant consisting of an HTR and a gas plant. **A77-50281**      **Optical properties of selectively absorbing Ni<sub>2</sub>/Al<sub>2</sub>O<sub>3</sub> composite films** H G Craighead and R A Buhrman (Cornell University, Ithaca, N.Y.) *Applied Physics Letters*, vol 31, Oct. 1, 1977, p 423-425, 6 refs NSF-ERDA-supported research

Composite films of Ni particles embedded in an Al<sub>2</sub>O<sub>3</sub> matrix have been produced by controlled coevaporation. The optical properties of the Ni/Al<sub>2</sub>O<sub>3</sub> composites measured over the range of the solar spectrum are in good accord with the predictions of Maxwell-Garnett (1904) theory, provided the Ni volume fraction is no more than about 0.2. The composite films have excellent spectral selectivity for the absorption of solar radiation, with a solar absorptivity of 0.94 obtained for a film produced with a composition gradient. Low-temperature emissivities of approximately 0.1 have

been obtained with composite films evaporated on highly reflecting metal substrates (Author)

**A77-50287** N-CdS/n-GaAs voltage-enhanced photoanode S Wagner and J L Shay (Bell Telephone Laboratories, Inc., Holmdel, N J) *Applied Physics Letters*, vol 31, Oct 1, 1977, p 446, 447 8 refs

The letter reports an n-CdS photoanode grown on an n-GaAs substrate. The photovoltage at the n-GaAs/n-CdS junction in series with the CdS/electrolyte junction increases the solar-cell efficiency by a factor of about 1.5 relative to a simple n-CdS photoelectrochemical solar cell (Author)

**A77-50292** Efficient sprayed In<sub>2</sub>O<sub>3</sub> Sn n-type silicon heterojunction solar cell J C Manificier and L Szepessy (Montpellier II, Université, Montpellier, France) *Applied Physics Letters*, vol 31, Oct 1, 1977, p 459-462 15 refs

Results are presented concerning an In<sub>2</sub>O<sub>3</sub> (tin-doped) n-type silicon heterojunction solar cell. The transparent and conductive In<sub>2</sub>O<sub>3</sub> Sn layer was made using a very simple, cheap, and quick method. Conversion efficiency up to 10 percent is reported. Typical parameters under AM1 simulated sunlight are an open-circuit photovoltage of 500 mV, short-circuit photocurrent of 32 mA/sq cm, and fill factors around 0.6-0.65 (Author)

**A77-50293** Enhancement of diffusion length in EFG ribbon solar cells under illumination C T Ho, R O Bell, and F V Wald (Mobil Tyco Solar Energy Corp., Waltham, Mass.) *Applied Physics Letters*, vol 31, Oct 1, 1977, p 463-465 6 refs

The short-circuit current, efficiency, and minority-carrier diffusion length of EFG (edge-defined film fed grown) ribbon silicon solar cells have been measured as a function of illumination level between 0 and 5 suns and found to increase. The faster rate of increase of the current in ribbon cells as compared with silicon crystals grown by the conventional Czochralski method is attributed to the enhancement of the minority-carrier diffusion length under illumination. A quasi-continuous deep-trap model with a Gaussian distribution of compensated donor states is proposed to account for these observations (Author)

**A77-50295** Cast polycrystalline silicon Schottky-barrier solar cells D R Lillington and W G Townsend (Royal Military College of Science, Shrivenham, Wilts., England) *Applied Physics Letters*, vol 31, Oct 1, 1977, p 471, 472 9 refs

Measurements have been made of the electrical and optical properties of polycrystalline metal-insulator-semiconductor Schottky-barrier solar cells formed by the evaporation of aluminum onto Wacker-Silco cast p-type silicon substrates. Results show that consistently high efficiencies under standard illumination conditions may be achieved using this material and that the voltage-current characteristics are stable over the period of testing. The short-circuit current of these devices (about 22 mA per square cm) indicates that grain-boundary recombination is not a serious problem (Author)

**A77-50350** RF oscillations of a plasma in crossed E x H fields. V T Karpukhin and P G Leonov (*Pis'ma v Zhurnal Tekhnicheskoi Fiziki*, vol 2, Dec 12, 1976, p 1084-1086) *Soviet Technical Physics Letters*, vol 2, Dec 1976, p 427, 428 Translation

Experiments were performed to study a helium-caesium discharge in a transverse magnetic field (in MHD generator conditions) in the following conditions: a helium pressure of 5-100 torr, a caesium pressure of 0.01-0.05 torr, a current density of 0.5-5 amps/sq cm, and a magnetic field strength of 0.7 kG. The longitudinal and Hall components of electric field in the plasma were measured and electron temperature and density were determined from the intensity of the recombination continuum of caesium. The dependence of the intensity of high frequency (in the range 80-100 MHz) oscillations on magnetic field was studied B J

**A77-50433** A large conventional MHD magnet J M Tarrh (Magnetic Engineering Associates, Inc., Cambridge, Mass.) *Institute of Electrical and Electronics Engineers, International Magnetism Conference, Los Angeles, Calif., June 6-9, 1977* *IEEE Transactions on Magnetism*, vol MAG 13, Sept 1977, p 1562-1564

A description is presented of a transverse field conventional electromagnet which has been designed and constructed to satisfy the requirements of a large private firm engaged in MHD research. The electromagnet has provided a peak central magnetic field of 4.2 T across a 0.267 m gap. The test data demonstrate that water-cooled hollow copper conductors can be used to produce high magnetic fields continuously over large volumes, without requiring extravagant amounts of materials of power. This is achieved without the complexity required by cryogenic or superconducting systems. Attention is given to details of electromagnetic design, aspects of mechanical design, and thermal design considerations G R

**A77-50499** Assuring the performance of fossil energy programs S S Canja (ERDA, Washington, D C) In *Annual Reliability and Maintainability Symposium, Philadelphia, Pa., January 18-20, 1977, Proceedings* Piscataway, N J, Institute of Electrical and Electronics Engineers, Inc., 1977, p 421-426

In an effort to achieve timely commercialization, ERDA/Fossil Energy has developed the Performance Assurance System (PAS), a technique for reducing uncertainties in the economics of proposed processes and improving plant and component operability. PAS aids the decision making functions of ERDA program managers and industrial contractors through systematic application of standardized data collection and exchange procedures, analytical methods, mathematical models and information transfer techniques. This paper reviews the status of PAS, emphasizing objectives, approach, benefits, and implementation B J

**A77-50651** Development of a turbine rotor of silicon nitride P Walzer, M Langer, and J Siebels (Volkswagenwerk AG, Wolfsburg, West Germany) *(U.S. Army Materials and Mechanics Research Center, Materials Technology Conference on Ceramics for High-Performance Applications, 5th, Newport, R I., Mar 21-25, 1977)* *Zeitschrift für Werkstofftechnik*, vol 8, Sept 1977, p 294-299. Research supported by the Bundesministerium für Forschung und Technologie

Gas turbines could potentially provide automobiles with power plants having very low pollutant emissions. However, at current operational temperatures gas turbines are not competitive with conventional power plants. A realization of the potential of the gas turbine for reducing automobile-related air-pollution levels depends, therefore, on the development of gas turbine components made of materials which will permit the elevation of the operational temperatures of the turbine to the required levels. A description is presented of a program designed to develop gas turbine components made of ceramics, giving particular attention to the use of silicon nitride. The fabrication of a multidensity rotor is discussed, taking into account the strength of prototype rotors, the thermal shock resistance of the components, and the oxidation resistance of the materials. G R

**A77-50688** Solar energy A U K assessment Research sponsored by the International Solar Energy Society and Wolfson Foundation London, International Solar Energy Society, 1976 379 p 271 refs \$17.40

Solar energy systems under development in the United Kingdom are discussed, with attention given both to domestic systems, which may supply 10 to 20% of the national energy needs, and to equipment designed for export. Studies presented address such technological and theoretical questions as spectral irradiance measurement techniques, diurnal variations in solar radiation, solar simulation methods, thermal performance of flat-plate collectors, energy storage techniques, solar cell design and the photochemical conversion of solar energy. Investigations of solar space heating applied to UK environments, agricultural applications of solar

energy, capital costs for solar water heating systems, a comparison of diesel and photovoltaic electric generation costs, nitrogen fixation by photosynthetic systems, reductive fixation of carbon dioxide and the photochemical decomposition of water are also reported J M B

**A77-51023\*** Where do we locate the moon base. J D Burke *Spaceflight*, vol 19, Oct 1977, p 363-366 14 refs Contract No NAS7-100

Because the lunar polar regions permit continuous solar energy collection and adjacent cryogenic temperature, they may be the preferred sites for early human occupation and use of the moon. If permafrost exists in the polar shaded regions, this preference will become dominant. Though not ideal from the point of view of all-sky coverage for astronomical observations, and also possibly subject to terminator-plane particle hazes near the surface, polar sites (especially the south polar region) may offer enough advantages (e.g., constant cryogenic telescope environments and unlimited tracking time) to be preferred sites for the first lunar observatories B J

**A77-51126** Power generation Air pollution monitoring and control Edited by K E Noll (Illinois Institute of Technology, Chicago, Ill.) and W T Davis (Tennessee University, Knoxville, Tenn.) Ann Arbor, Mich., Ann Arbor Science Publishers, Inc., 1976 563 p. \$27.50

An engineering guide for predicting dispersion of emissions is provided and aspects related to the monitoring of power plant emissions are considered, taking into account a simplified technique used to evaluate atmospheric dispersion of emissions from large power plants, the estimation of downwash effects, the design of air monitoring surveys near large power plants, airborne and mobile ground level measurements of pollutants in the sphere of influence of a coal-fired electric generating station, a calibration procedure for continuous air monitoring instruments, the sampling and analysis of trace metals in the atmosphere, and the monitoring of industrial sulfur scrubbers by flame photometry. Attention is also given to intermittent control systems for sulfur dioxide, the removal of sulfur dioxide from stack gases, and the control of particles from power generation G R

**A77-51128** Eliminate source emission codes for coal-refuse fired power plants. F A Brunner (Sverdrup and Parcel and Associates, Inc., St. Louis, Mo.) In *Power generation Air pollution monitoring and control* Ann Arbor, Mich., Ann Arbor Science Publishers, Inc., 1976, p 29-33 9 refs

An investigation is conducted regarding the feasibility of an implementation of proposals related to the conversion of coal-fired, steam-electric power plants to operate on both municipal refuse and coal. Operational problems concerning such a conversion are partly related to an increase in the storage space required. The storage space needed for refuse is about five times as large as the space required for coal. Attention is given to differences in the ash content of coal and refuse, methods of handling the associated waste from the conversion, and separate emission regulations for dual-fuel power plants established by some states. It is proposed to eliminate the risk of halting operation due to exceeding state emission standards and to give recognition to existing plant limitations by testing each anticipated fuel-converted plant solely according to the limits of the ambient air standards in each specific area plant setting G R

**A77-51135** Airborne and mobile ground level measurements of pollutants in the sphere of influence of a coal-fired electric generating station. N T Stephens (Virginia Polytechnic Institute and State University, Blacksburg, Va.), A. N. Bird, Jr., and J D. McCain (Southern Research Institute, Birmingham, Ala.) In *Power generation Air pollution monitoring and control* Ann Arbor, Mich., Ann Arbor Science Publishers, Inc., 1976, p 153-168 7 refs. Research supported by Southern Services

**A77-51144** Status of sulfur dioxide removal systems for the electric utility industry. T. W. Devitt and T. C. Ponder, Jr

(PEDCO-Environmental Specialists, Inc., Cincinnati, Ohio) In *Power generation Air pollution monitoring and control*.

Ann Arbor, Mich., Ann Arbor Science Publishers, Inc., 1976, p 307-317

The current state of the art of flue gas desulfurization (FGD) technology in the U.S. is evaluated. Fourteen of the 21 FGD systems on utility size boilers which were in operation on Feb. 1, 1975, were based on a use of lime or limestone. Two systems used a magnesium oxide scrubbing process, two employed sodium carbonate, two utilized a double alkali procedure, and one made use of catalytic oxidation. The reliability and availability of FGD systems is considered and an operating summary for FGD systems is presented. A brief description is provided of the results of studies which have evaluated the cost of controlling the particulate and sulfur dioxide emissions from utility boilers G R

**A77-51146** Flue gas desulfurization by fly ash. H I Zeliger In *Power generation Air pollution monitoring and control* Ann Arbor, Mich., Ann Arbor Science Publishers, Inc., 1976, p 379-390 11 refs

A summary is presented of the chemistries of 11 flue gas desulfurization (FGD) processes and a description is provided of the results of a study concerned with the selection of an FGD process for a power station which uses as fuel a low-sulfur lignite which is site-specific. The selected fly ash/lime process is discussed, giving attention to the absorber gas system, the absorber-recycle system, the reagent system, the disposal recycle system, the clarifier system, and the overall material balance G R

**A77-51148** Electrostatic precipitator design for western coals. W A Baxter (Environmental Elements Corp., Baltimore, Md.) In *Power generation Air pollution monitoring and control*

Ann Arbor, Mich., Ann Arbor Science Publishers, Inc., 1976, p 415-425 6 refs

The vast reserves of strippable low-sulfur coal contained in the 17 western states can possibly provide the utility industry with a substantial part of the fuel needed for its operation. However, the specific properties of this coal will make it necessary to modify equipment originally designed for eastern and mid-western fuels. An overview is presented of the techniques in use today to adapt electrostatic precipitator design for the reliable high-efficiency collection of the fly ash emanating from the burning of western coals. Attention is given to the precipitation process, high acceleration rapping, high temperature operation, low temperature operation, conditioning, wet precipitation, and precipitation specification G R

**A77-51152** Air pollution control for industrial coal-fired boilers. A H Jones (Joy Manufacturing Co., Los Angeles, Calif.) In *Power generation Air pollution monitoring and control*

Ann Arbor, Mich., Ann Arbor Science Publishers, Inc., 1976, p 529-542

The role that sulfur plays in the burning of fossil fuels is examined and a description is presented of the design and the principles of operation of an electrostatic precipitator which separates dust, fume, or mist from a gas stream by exposing the stream to a high voltage field. Cloth baghouses are discussed, taking into account the use of woven cloth, needled felt, glass in the fabric, reverse flow glass fabric filters, shaker-type glass baghouses, and pulse jet-type filters. Cyclonic collectors and wet scrubbers are also considered and attention is given to equipment costs and questions of sulfur dioxide removal G R

**A77-51153** Approaches leading to an efficient use of energy, illustrated with the aid of examples concerning the rail traffic and low-temperature heat requirements (Wege zum rationalen Energieverbrauch, gezeigt am Beispiel des Schienenverkehrs und des Niedertemperaturwärmebedarfs). K Bauermeister (Deutsche Bundesbahn, Frankfurt am Main, West Germany), C Brecht (Ruhrgas AG, Essen, West Germany), H Schaefer (München, Technische Universität, Munich, West Germany), and B Stoy (Rheinisch-Westfälisches

Elektrizitätswerk AG, Essen, West Germany) *Brennstoff-Wärme-Kraft*, vol. 29, Sept 1977, p. 347-352. In German

An improvement of the efficiency of processes involved in obtaining, converting, distributing, and employing energy makes it possible to lower specific energy requirements. An improvement of this efficiency implies in most cases that expenses for increased capital investment take the place of a part of the costs for energy. The economic aspects of such a replacement improve with increases in the cost of fuel. Savings related to lower expenditures for environmental protection in connection with lower energy consumption must also be taken into consideration. Attention is given to heat conservation approaches employed in the case of new houses and buildings in West Germany, the utilization of solar radiation, the reduction of the heat losses of hot-water storage, the employment of heat pumps, an extended use of electric locomotives, the use of natural gas in gas heat pumps, and various approaches leading to a minimization of traffic-related energy requirements. G.R.

**A77-51154** Improvements in energy conversion technology (Verbesserungen in der Energieumwandlungstechnik). K. Knizia, G. Hirschfelder, D. Schwarz, and K. Weinzierl (Vereinigte Elektrizitätswerke Westfalen AG, Dortmund, West Germany). *Brennstoff-Wärme-Kraft*, vol. 29, Sept 1977, p. 353-360. In German

Requirements concerning an improvement of the processes and techniques employed in connection with energy-consuming applications are related to the need to enhance the efficiency of energy utilization and to environmental-protection considerations. The necessity to replace fuels in short supply with other forms of energy is also an important factor. Developments related to an improvement of conventional processes are examined, taking into account an enhancement of steam-turbine efficiency, the significance and the processes of coal gasification, and factors which affect the efficiency of coal gasification installations. Problems and possibilities regarding a use of nuclear installations are also evaluated. The vast expenditures required for the development of new systems are only justified in the case of great qualitative advantages. Such advantages are provided by the fast breeder and the high-temperature reactor. G.R.

**A77-51155** Combined heat and electricity generation as a means for saving primary energy (Kombinierte Wärme- und Elektrizitätszeugung als Weg zur Primärenergieeinsparung). H. Schulte. *Brennstoff-Wärme-Kraft*, vol. 29, Sept 1977, p. 366-370. In German

It is pointed out that the energy losses in energy-conversion processes in West Germany are about 67%. An investigation is conducted regarding the approaches which can be used to reduce these losses. Energy currently lost in connection with the conversion of fossil and nuclear primary energy into electric energy can be utilized for space heating applications, which, in West Germany, consume about 40% of the total amount of primary energy used. Approaches for implementing methods involving such a utilization are discussed, taking into account details of heat transfer, the transportation of the heat from the power plant to the location where it is used, and questions concerning the required investment costs. A description is presented of a project designed to demonstrate the feasibility of the considered concepts. The construction costs for the required installations are about 175 million DM. G.R.

**A77-51156** The future production of liquid and gaseous hydrocarbons through coal gasification and the long-term prospects of a hydrogen technology (Die zukünftige Bereitstellung von flüssigen und gasförmigen Kohlenwasserstoffen durch Vergasung von Kohle und die langfristigen Aussichten für eine Wasserstofftechnologie). W. Peters (Steinkohlenbergbauverein, Essen, West Germany), R. Schulten (Kernforschungsanlage Jülich GmbH, Jülich, West Germany), and P. Speich (Rheinische Braunkohlenwerke AG, Cologne, West Germany). *Brennstoff-Wärme-Kraft*, vol. 29, Sept 1977, p. 371-376. 21 refs. In German

**A77-51157** Development of new technologies for energy production in the Federal Republic of Germany (Entwicklung neuer

Technologien zur Energieerzeugung in der Bundesrepublik Deutschland). W.-J. Schmidt-Kuster and H. F. Wagner (Bundesministerium für Forschung und Technologie, Bonn, West Germany). *Brennstoff-Wärme-Kraft*, vol. 29, Sept 1977, p. 377-383. In German

The development of new energy technologies is necessary to assure the medium-term and long-term supply of the economy with energy and to aid the countries of the third world in solving their energy problems. Nuclear energy represents currently for West Germany the only available new technology that has the potential to provide energy which can replace on a short-term or medium-term basis a significant part of petroleum-related fuels. An enhanced utilization of coal and lignite reserves requires the development of new conversion technologies which are costwise and with respect to environmental considerations acceptable. A number of difficulties will have to be overcome before an economic use of solar energy for space-heating and hot-water supply applications will be possible. Attention is also given to developments and prospects concerning the utilization of solar energy in its various forms for other applications, technologies for a more efficient use of energy, and studies concerning controlled nuclear fusion. G.R.

**A77-51161** Optical study of fixed spherical solar collectors (Etude optique des capteurs solaires sphériques fixes). B. Authier (CNRS, Laboratoire d'Astronomie Spatiale, Marseille, France). *Journal of Optics*, vol. 8, Sept-Oct 1977, p. 331-337. 6 refs. In French

A procedure is developed for finding radiation (sunlight) incident along the sagittal line of a spherical solar collector. The analysis is developed on the basis of geometric optics, for the cases point source on the mirror axis at infinity, single or multiple reflections, point source off axis at infinity, mobile mirror elements. The amount of radiation intercepted is increased via addition of a sun-tracking mobile mirror element, termed boresight ('visière'), under tropical insolation conditions. R.D.V.

**A77-51169** General Electric prepares the LM5000 for testing. *Gas Turbine International*, vol. 18, July-Aug. 1977, p. 52, 53

The LM5000 dual rotor industrial gas generator is described, along with its full-scale testing program. The single-stage low-pressure turbine for the low-pressure compressor and the two-stage high-pressure turbine for the high-pressure compressor and the annular combustor are described briefly. The LM5000 design is derived from the CF6-50 commercial aviation turbofan engine. Major modules are completely replaceable subsystems. The LM5000 is rated at 40,000 to 60,000 isentropic gas horsepower. R.D.V.

**A77-51256** On pressure-work, viscous dissipation and the energy balance relation for geothermal reservoirs. S. K. Garg and J. W. Pritchett (Systems Science and Software, La Jolla, Calif.). *Advances in Water Resources*, vol. 1, Sept 1977, p. 41-47. 11 refs. NSF Grant No. ENV-75-14492-A01

This article examines the conditions under which the pressure-work and viscous dissipation terms should be retained in the energy balance relation for single (liquid water or vapor) and two-phase (liquid water and vapor) fluid flow through porous media. It is shown that if one wishes to retain the pressure-work term, then one must also keep the viscous dissipation term in the energy balance. Consideration of steady non-isothermal radial flow demonstrates that both pressure-work and viscous dissipation are liable to have negligibly small effects in single phase liquid water and in two-phase liquid-vapor systems. This conclusion is, however, not generally valid for pure vapor systems, in this case, pressure-work and viscous dissipation can produce significant variations in the computed reservoir response. (Author)

**A77-51257** A comparison between experimental and numerical investigations of the motion of the water surface in a model surge tank. P. W. France (University of Wales Institute of Science and Technology, Cardiff, Wales). *Advances in Water Resources*, vol. 1, Sept. 1977, p. 49-51

This paper describes an investigation into the motion of the water surface in a simple model surge tank, and the relevant factors governing its behaviour. The oscillation of the free water surface is an unsteady flow problem, which is amenable to a mathematical solution using a finite difference step-by-step integration procedure. For comparison, two such methods are presented (1) a simple initial value method and (2) a predictor-corrector technique. Computer programs have been developed linked to a graph plotter to give a visual presentation of the numerical solutions together with the experimental results of the damped oscillation of the water surface in the model surge tank. (Author)

**A77-51279** Water and energy systems - A planning model  
E D Brill, Jr, S G Velioglu, and R W Fuesle (Illinois, University, Urbana, Ill.) *American Society of Civil Engineers, Water Resources Planning and Management Division, Journal*, vol 103, May 1977, p 17-32. 22 refs. Research supported by the U S Department of the Interior.

The implementation of plans regarding the utilization of the vast coal reserves in the Ohio River Basin area in connection with the need for a replacement of petroleum-derived fuels and natural gas would require the use of large quantities of water. In considering the withdrawal of the required water, attention must be given to other existing and potential demands for the water resources, including, in particular, the water currently used for electricity generation. An investigation is conducted regarding the relationships and interactions between the various water-consuming systems. The investigation makes use of a planning model which is to serve as a tool for evaluating some aspects of the major policy issues in a large region such as a state. The components, constraints, and limitations of the model are discussed. (Author)

**A77-51284** Pumped storage optimization in generation systems  
J S Windsor (Natal, University, Durban, Republic of South Africa) *American Society of Civil Engineers, Water Resources Planning and Management Division, Journal*, vol 103, May 1977, p 99-109. 7 refs.

An investigation is conducted regarding some of the economic fundamentals which have to be considered in power system planning. A description is presented of a form of mixed integer programming which can be used to determine the optimal planning policy for an expanding electric power system, with special reference to the integration of pumped-storage schemes into the overall system. Mathematically, the problem is a dynamic nonconvex programming problem in which the nonconvexities are caused by economies of scale associated with the cost of building and operating the power facilities. (Author)

**A77-51366** Technical, economic, and environmental evaluation of in situ coal gasification  
T F Edgar (Texas, University, Austin, Tex.) *In Situ*, vol 1, no 1, 1977, p 75-102. 11 refs. Research supported by the Atlantic Richfield Co, Continental Oil Co, Dow Chemical Co, Du Pont de Nemours and Co, Enserch, Mobil Oil Corp, Shell Oil Co, Texas Utilities and NSF.

Underground coal gasification is a process which should be considered as a competitor on an economic basis with shaft mining of coal. However, not all coal seams and locations are viable candidates for the application of this technology. The important factors in site evaluation, including coal properties, geological conditions, and operating parameters, as well as the economics of underground coal gasification, are discussed. Specific reference to the Soviet system of underground gasification is given. (Author)

**A77-51370** Heating with solar energy (Le chauffage par l'énergie solaire)  
M Caratsch (Sulzer Frères, S A, Division Chauffage et Climatisation, Winterthur, Switzerland) *Revue Technique Sulzer*, vol 58, no 4, 1976, p. 151-157. In French.

The article describes and compares several types of solar cell panels and heat storage units, conditions favoring profitable exploitation of solar energy (economic, meteorological), and describes some existing solar energy installations. Effects of water vapor content and

dust loading of air, rural air, misty and foggy weather, daily variations of direct and diffuse sunlight, and seasonal variation of insolation are described and plotted. Single-pane and double-pane solar cell panels and their performance are compared for various temperature differences and monthly-average insolation data. Rural and urban use of solar energy for space heating and cooling, and for hot water supplies, are considered. (Author)

**A77-51372** Hydrogen absorption in Ti3Al  
P S. Rudman (Technion - Israel Institute of Technology, Haifa, Israel), J J Reilly, and R H Wiswall (Brookhaven National Laboratory, Upton, N Y.). *Bunsen-Gesellschaft für Physikalische Chemie, Berichte*, vol 81, Jan 1977, p 76-80. 10 refs. ERDA-sponsored research.

The reported investigation had the objective to study the effect of aluminum on the fundamental thermodynamic parameters of hydrogen absorption in Ti in connection with the potential significance of Ti based alloys for hydrogen storage applications. Typical absorption/desorption isotherms for hydrogen in Ti3Al at temperatures of 450, 550, 650, and 750 C for the hydrogen dissociation pressure range from 0 to 1000 Torr are presented in a graph. The obtained results are compared with data for pure Ti compiled by Gallagher and Oates (1969). The effect produced by Al appears to be interpretable as the blocking of interstitial sites from hydrogen occupancy. (Author)

**A77-51390** Past experience - Basis for future advanced power systems for communications satellites  
B Gohrbandt and J Rath (Telefunken AG, Wedel, West Germany) *International Astronautical Federation, International Astronautical Congress, 28th, Prague, Czechoslovakia, Sept 25-Oct 1, 1977, Paper 77-22*. 18 p. 5 refs.

Multi-kilowatt solar power systems for advanced communications satellites are discussed. Solar generators with foldable or roll-out blankets and power outputs of 20 kW or greater are described, the power/mass ratios for various configurations of the flexible solar generators are compared. Problems associated with solar arrays, such as high initial power outputs and subsequent degradation, the need for advanced nickel-cadmium and nickel-hydrogen storage batteries, and charging of the solar generators by the plasma environment, are also mentioned. Modular design of booms, actuators and solar array blankets, as well as development of pulse-width-modulation shunt regulators and a c power distribution systems for satellite applications are considered. (Author)

**A77-51411** Studies of technological processes by solar energy under cosmic simulated conditions  
I N Frantsevich, V I Trefilov, V S Dverniakov, V V Pasichny, and I E Kasich-Pilipenko (Academy of Sciences, Intercosmos Council, Moscow, USSR) *International Astronautical Federation, International Astronautical Congress, 28th, Prague, Czechoslovakia, Sept 25-Oct 1, 1977, Paper 77-54*. 7 p. 5 refs.

Welding was studied in the SGI-5 solar furnace heated with the aid of a 2-m-diameter parabolic mirror. The radiant flow ranged from 150 - 1900 W/sq cm. The effects of radiant flow efficiency, process speed, and joint type on the size and shape of the weld pool were studied. Various alloys in the form of 0.25 - 2.0-mm-thick flat plates (or cylinders) with weld joints were used, and solders are described. The appearance and properties of the welds are reported and compared with welds obtained by more common procedures. The results can be applied to the development of solar energy welding techniques which can be used in the low-gravity environment of space. The desirable features of welds formed in such an environment are summarized. (Author)

**A77-51415** Space power stations - Space construction, transportation, and pre-development, space project requirements.  
R Piland (NASA, Johnson Space Center, Houston, Tex.) *International Astronautical Federation, International Astronautical Congress, 28th, Prague, Czechoslovakia, Sept 25-Oct 1, 1977, Paper 77-64*. 45 p. 9 refs.

Several features of solar energy space power stations are discussed. An end-to-end analysis of a system using silicon solar cells is reviewed, and the merits of construction in low earth orbit and in geosynchronous orbit are compared. A suggested space construction procedure, described in detail, would use a 'beam builder', an automated machine, to fabricate the first sublevel truss structural members from strip stock material that is stored on reels. An assembly jig would then be used to position a number of beam builders in the proper location and to support the beams as they are produced to facilitate joining them to form the final space power station structure. Space projects for evaluating the construction concept are proposed, and a possible space construction sequence is considered. Space transportation that would be required in conjunction with the space power station is described. M L

**A77-51416** Composites for large space structures J. F. Garibotti, R. J. Reck, and A. J. Cwiertny (McDonnell Douglas Astronautics Co., Huntington Beach, Calif.) *International Astronautical Federation, International Astronautical Congress, 28th, Prague, Czechoslovakia, Sept. 25-Oct. 1, 1977, Paper 77-65* 37 p 12 refs

The use of graphite-polyimide or graphite-epoxy truss beams, panels and tubing in large space structures, such as solar power satellites, multibeam lens antenna systems or parabolic radiometers, is discussed. Advantages of the advanced composites, including a high degree of stiffness, good thermal stability, as well as high packaging density for the trip to orbit, are considered. The design of truss elements and joints is studied, and fabrication techniques, such as pultrusion, braiding and chopped-fiber molding (for joints), are compared. Contamination of the composites due to inert gases, lubricants or toxic volatiles from cleaning solutions, is also considered. J M B

**A77-51431** Experimental research of oscillations in the discharge gap of plasma accelerator. V. P. Shadov and K. V. Evdokimov (Academy of Sciences, Intercosmos Council, Moscow, USSR) *International Astronautical Federation, International Astronautical Congress, 28th, Prague, Czechoslovakia, Sept. 25-Oct. 1, 1977, Paper 77-104* 7 p.

The amplitude-frequency performance of plasma accelerators in the discharge gap are studied with attention to the electromagnetic oscillations originating in the main and near-electrode zone, the potential oscillations in these zones as well as their spatial-time distributions, and the supply circuit electric oscillations at transient conditions which depend on the discharge current, working fluid flow rate, and cathode temperature. A lithium plasma accelerator with tungsten electrodes was used in this study. An autocorrelative function of the fluctuations provides information on the mean spectrum frequency and the mean wave vector over the correlative function period, and the directions of propagation and the mean phase velocity of oscillations. The implications of experimental data are discussed. M L

**A77-51444** A new cycle for optimum energy storage in interplanetary missions E. Igenbergs (München, Technische Universität, München, West Germany) *International Astronautical Federation, International Astronautical Congress, 28th, Prague, Czechoslovakia, Sept. 25-Oct. 1, 1977, Paper 77-141* 40 p

An investigation is conducted concerning an approach in which a spacecraft on a mission obtains energy from nuclear power plants or by the utilization of solar radiation and stores this energy for an employment in energy-consuming operations to be performed at a later time. In a brief analysis it is demonstrated, in a comparison of various possibilities that, of the considered systems, only a system which stores energy chemically in the form of elementary oxygen and hydrogen, obtained from water, provides a feasible low-weight energy storage method. A solar mirror-turbine/generator system and a system obtaining electric energy for the decomposition of water by means of solar cells are considered. The water formed, when the stored energy is withdrawn for use, is retained and can be employed again for additional energy-storage cycles. Formulas and graphs are

presented which illustrate the suitability of the discussed techniques for a number of spacecraft missions, giving particular attention to interplanetary missions to Mars and Venus. G R

**A77-51445** Automatic optimization of operating modes in thermionic electrical power generators L. M. Galkin, B. N. Petrov, and G. M. Ulanov (Institute of Control Sciences, Moscow, USSR) *International Astronautical Federation, International Astronautical Congress, 28th, Prague, Czechoslovakia, Sept. 25-Oct. 1, 1977, Paper 77-142* 17 p 6 refs

The characteristics of a spacecraft power supply system consisting of thermionic converters which receive heat from a nuclear reactor source are examined. Using the experimental Soviet Topaz unit as an example, attention is given to ways of optimizing the operating mode, conversion efficiency, service life and reliability of a thermionic power system. It is decided that an adaptive control system which would maintain the optimal operating mode in the face of wide variations of system parameters is the best choice. B J

**A77-51508** Introductory remarks on space observations of long-term climatic changes produced by escalating energy use S. S. Penner (California, University, La Jolla, Calif.) *International Astronautical Federation, International Astronautical Congress, 28th, Prague, Czechoslovakia, Sept. 25-Oct. 1, 1977, Paper A-77-01* 6 p 24 refs

Additions of CO<sub>2</sub> to the earth's atmosphere as a result of intensified worldwide economic and industrial activity are assessed for possible long-term climate-altering effects. Effects of accumulated CO<sub>2</sub> (including greenhouse effects) are considered more serious than effects of atmospheric particulate loading or direct heat addition at the present time. Mention is made of contributions by volcanic activity to climate alteration, possible use of space-positioned mirrors to moderate the earth's albedo, and laser absorption techniques for measuring mean temperatures in the atmosphere. R D V

**A77-51524** On the active and passive CETI from earth satellite orbit M. Subotowicz (Lublin, Uniwersytet, Lublin, Polskie Towarzystwo Astronautyczne, Katowice, Poland), J. Usowicz (Torun, Uniwersytet, Torun, Polskie Towarzystwo Astronautyczne, Warsaw, Poland), and Z. Paprotny (Polskie Towarzystwo Astronautyczne, Katowice, Poland) *International Astronautical Federation, International Astronautical Congress, 28th, Prague, Czechoslovakia, Sept. 25-Oct. 1, 1977, Paper A-77-48* 14 p 7 refs

Technical problems involving the antennas considered for use in a communication with extraterrestrial intelligence (CETI) satellite project are discussed. The antenna system and monitoring are considered with reference to a search strategy. Topics examined include frequency range, thermal noises and deformations, Doppler shift correction, compensation of the dispersal effects, transmission time and distance, costs, and energy supply by the solar satellite power station. Attention is directed to the problems of possible perturbations of the orbit, undesirable motion of the antenna, and antenna mechanical oscillations. M L

**A77-51532** Space solar power versus space communications S. K. Sarkar (Swiss PTT, Berne, Switzerland) *International Astronautical Federation, International Astronautical Congress, 28th, Prague, Czechoslovakia, Sept. 25-Oct. 1, 1977, Paper 77-65* 8 p 8 refs

Since a space solar power station will occupy the same geostationary orbit as communications satellites and will also use the RF spectrum for transmission there must be a tradeoff between the two types of spacecraft in terms of resource allocation of orbit and spectrum. This paper briefly reviews design, operating and cost factors for both types of space system and emphasizes resource constraints and comparative benefits. The solar power station concept is criticized as being cost-ineffective. B J

**A77-51533** Socio-economic determinants of a program for lunar industrialization in support of space light development Lunetta and Soletta K. A. Ehrlicke (Space Global, Inc., La Jolla, Calif.)

*International Astronautical Federation, International Astronautical Congress, 28th, Prague, Czechoslovakia, Sept 25-Oct 1, 1977, Paper A-77-66 59 p 10 refs*

Some ideas for space light facilities are outlined. The Lunetta system is for illumination. The Powersoletta system is for transmission of solar energy to drive terrestrial solar-electric power stations at night in addition to their operation by direct solar energy during the day. The Biosoletta system is for transmission of radiation energy for purposes of enhancing photosynthetic (food) production, and of thermal energy for local temperature modification. P T H

**A77-51561** International law and solar energy satellites. H Berger. *International Astronautical Federation, International Astronautical Congress, 28th, Prague, Czechoslovakia, Sept 25-Oct 1, 1977, Paper SL-77-52 19 p 27 refs*

Articles of the December 8, 1956 Treaty on Principles Governing the Activities of States in the Exploration and Use of Outer Space, including the Moon and Other Celestial Bodies are examined with reference to their bearing on solar energy satellites. The first nine articles are considered; these articles deal with subjects such as the exploration of space, the prohibition of national appropriation of space resources, the requirements for conformity with international law, and liability. Topics which will require legal clarification include general questions, such as the freedom of use of outer space for transmission of energy to earth, and more specific issues, such as the allocation of frequencies for transmission of energy waves. Three other multilateral agreements are also mentioned. M L

**A77-51565** International law and the use of outer space for the production of solar power. L I Tenner. *International Astronautical Federation, International Astronautical Congress, 28th, Prague, Czechoslovakia, Sept 25-Oct 1, 1977, Paper SL-77-62 28 p 97 refs*

The paper examines the international legal ramifications of establishing and operating permanent space colonies to construct solar energy collecting satellites which would transmit the energy to earth via microwave. The Outer Space Treaty and other present and projected treaties contain provisions directly applicable to this type of project. The main issue concerns the ban on appropriation of outer space. Placement of a colony in geostationary orbit or at a Lagrange position may or may not be a violation of the Treaty. The Treaty also requires that activities of states in the exploration and use of outer space shall be carried out in the interests and for the benefit of all mankind. If world-wide sharing of the benefits of a solar energy satellite were required, the program may become economically unfeasible. Perhaps the producing state should just be required to make the electrical power or technological information available for purchase by other states on a nondiscriminatory basis. P T H

**A77-51575** Future space experiments with levitated capacitor for thermonuclear microexplosions. D Odstrcil. *International Astronautical Federation, International Astronautical Congress, 28th, Prague, Czechoslovakia, Sept 25-Oct 1, 1977, Paper 77-ST-11 12 p 5 refs*

The use of controlled thermonuclear microexplosions for space propulsion systems is considered. An electron beam method would be used for ignition, and a capacitor consisting of a superconducting torus is suggested for energy storage. Characteristics of this proposed capacitor are analyzed, and a space test platform that could be used to study the capacitor is described. M L

**A77-51587** Mathematical modelling of coal combustion in fluidized beds with sulphur emission control by limestone or dolomite. T P Chen and S C Saxena (Illinois, University, Chicago, Ill.). *Fuel*, vol 56, Oct 1977, p 401-413. 32 refs. Contract No E(49-18)-1787

A model is developed for the combustion of coal in fluidized beds with sulphur emission control by limestone or dolomite. The gas and solid flow analysis is based on multiple gas bubbles of varying sizes which, accompanied by the cloud and wake, rise through the

particulate emulsion phase. Solids population balance relating the feed, overflow, and elutriation with the physiochemical changes of particles in the bed is carried out for coal and sulphur-absorbent respectively. The reactions in the bed are then formulated in terms of the above determined gas velocities and distribution functions for solids. Experimental data from various pilot-plant operations are used to assess the validity of the proposed model. The observed coal conversion and sulphur retention under various operating conditions are in good agreement with the predicted values. (Author)

**A77-51588** Ignition of droplets of liquid fuels solvent extracted from coal. J B Jordan, A Williams (Leeds University, Leeds, England), and G M Kimber (Coal Research Establishment, Cheltenham, Glos, England). *Fuel*, vol 56, Oct 1977, p 417-421. 27 refs

A single suspended-droplet technique has been used to study droplet combustion of a range of solvent-refined coal extracts in a furnace at 850 C. The small particles of extract are solid at room temperature but they rapidly liquefy on exposure to the hot furnace environment, permitting the size and mass-time combustion histories to be measured. Their combustion behaviour is discussed in terms of their high aromaticity and comparison with the single droplet combustion of fuel oils of different asphaltene content was used to highlight potential solids emissions problems which may arise when firing in large systems. (Author)

**A77-51589** Heavy-fuel flame radiation in gas turbine combustors - Exploratory results. E. M. Goodger and Y S. H. Najjar (Cranfield Institute of Technology, Cranfield, Beds, England). *Fuel*, vol 56, Oct 1977, p. 437-440. 6 refs

With lower costs and greater availability, heavy fuel oil appears as an attractive alternative to the conventional gas oil used in industrial gas turbines. However, higher levels of radiation and smoke are expected, and this note reports on some preliminary tests made with a combustion chamber burning fuels of different carbon content, ranging from kerosine to a 25% blend of residual fuel oil in gas oil, at a chamber pressure of 10 atm. The combustion rig was equipped with a total-radiation pyrometer and black-body furnace capable of measurement at different axial stations along the spray-stabilized flame. The presence of the residual fuel oil in the gas oil was found to promote significant increases in the mean levels of radiation, emissivity and smoke density, with a modest increase in liner temperature. (Author)

**A77-51590** Concurrent carbon gasification and carbon deposition in chars. A Linares Solano, O P Mahajan, and P L Walker, Jr (Pennsylvania State University, University Park, Pa.). *Fuel*, vol 56, Oct 1977, p 451, 452. 11 refs. Contract No E(49-18)-2030

The paper introduces the concept of the concurrent carbon gasification and carbon deposition in chars and notes that the rates of these two processes are interdependent with an interdependence that can change with the particular char used. In an experimental study, chars were produced from a Montana lignite and Saran (a copolymer of polyvinylidene chloride and polyvinyl chloride) by heating them to 1000 C and soaking for 2 h in N<sub>2</sub>. Weight changes produced in the acid-washed lignite char and in the Saran char, both at 900 C in various atmospheres, were observed. Results showed effects ranging all the way from the gasification reaction promoting a high rate of carbon deposition from methane, to carbon deposition completely retarding the gasification reaction. and *Electronics Engineers, Joint Power Generation Conference, Long Beach, Calif., Sept 18-21, 1977, ASME Paper 77-JPGC-Pwr-1*. 13 p 35 refs Members, \$1 50, nonmembers, \$3 00

An appraisal of evidence that sulfur dioxide and the sulfate ion are harmless at the concentrations created by acceptable emission techniques, together with the acceptance of the value to the land of an atmospheric supply of sulfur, leads to the conclusions that there are no problems which the development of flue gas desulfurization would solve, there is no case for the development of low-sulfur fuels for large installations, the U S consumption of raw coal could be much greater than at present without deleterious effects, there will be a need for the provision, probably from coal, of low-sulfur energy for urban use, and research and development should be diverted from non-existent problems to directions where a real need exists.

**A77-51623 #** A new approach to planning with gas turbines B. M. Kaupang and W. D. Marsh (General Electric Co, Schenectady, N Y) *American Society of Mechanical Engineers and Institute of Electrical and Electronics Engineers, Joint Power Generation Conference, Long Beach, Calif., Sept 18-21, 1977, ASME Paper 77-JPGC-GT-3* 7 p Members, \$1 50, nonmembers, \$3.00.

Gas turbines have traditionally been accepted by most the utility industry as an economic means for serving peak loads In the last few years, rapidly escalating fuel and capacity costs together with uncertainty regarding oil availability have raised questions as to whether gas turbines should still be applied for this purpose This paper will analyze the basic economic and operating principles of peaking generation and discuss how a new approach to the planning process shows why gas turbines still make economic sense in today's environment of tight supplies of capital and oil The techniques, discussed in this paper, for investigating the economic impact of gas turbine participation in utility plans for generation additions should contribute to the understanding and optimum utilization of the gas turbine in the utility industry

The potential use of coal-derived aviation fuels was assessed. The studies addressed the prices and thermal efficiencies associated with the production of coal-derived aviation kerosene, liquid methane and liquid hydrogen and the air terminal requirements and subsonic transport performance when utilizing liquid hydrogen. The fuel production studies indicated that liquid methane can be produced at a lower price and with a higher thermal efficiency than aviation kerosene or liquid hydrogen. Ground facilities of liquefaction, storage, distribution and refueling of liquid hydrogen fueled aircraft at airports appear technically feasible. The aircraft studies indicate modest onboard energy savings for hydrogen compared to conventional fuels. Liquid hydrogen was found to be superior to both aviation kerosene and liquid methane from the standpoint of aircraft engine emissions. Author

A design concept is described for the production of methane, hydrogen, and ammonia using solar energy. Filamentous, nitrogen fixing blue-green algae are employed as a source of biomass for methane and ammonia generation by anaerobic digestion and as a biological catalyst for the photoproduction of hydrogen from water. The resources needed, biomass production and harvest, anaerobic digester, the process of biophotolysis, and product separation are discussed. The environmental and genetic modifications possible to increase biomass production are indicated. Preliminary cost estimates are made for methane and hydrogen production. It is concluded that biosynthetic methane is not economically competitive with that derived from coal gasification but that hydrogen production offers a viable long range prospect. Author (ERA)

An experimental pilot-plant program is described which has demonstrated that specification JP-4 wide-cut type and Jet A narrow-cut type aviation turbine fuels may be produced from domestic shale oils. Three shale oils and two coal-derived liquids were evaluated in the program, which is the second phase in a three phase overall program. The original whole crude samples were assayed and fractionated to yield kerosene-boiling-range feedstocks for catalytic hydrotreatment experiments. Three levels of hydrotreatment severity were investigated, using nickel-molybdenum and cobalt-molybdenum catalysts. Hydrotreated products were fractionated and rebled to yield finished fuels. The experimentally obtained process and analytical information will be used in the third phase of the program to provide a basis for an engineering and economic evaluation of the effect of the use of synthetic crude oil in a refinery processing both petroleum and synthetic crude. A summary of six projects that use computer simulation models to explore the potential role of coal as a transition fuel is presented. A dynamic simulation model that explores the

interaction between energy availability and economic growth during the transition from fossil fuel energy sources to ultimate energy sources was developed. Major areas where policy tests significantly affect the transition to coal were identified. The environmental standards study analyzes the nature of the constraint on increased coal use imposed by the problem of air pollution by sulfur dioxide emissions. An analysis on energy imports and international politics indicated the sensitivity of the study model to an increased rate of imports and its inability to cope with the strains generated by increased reliance on external sources. Hydrogen must be manufactured from basic energy resources since it is not a naturally occurring energy form. The question of the feasibility of the use of hydrogen as a fuel was studied. Although it is generally believed that hydrogen might soon become less expensive than petroleum, competition among fuels in the energy marketplace and the need to derive hydrogen from other energy sources will insure that hydrogen does not become less expensive than alternatives for a very long time. Transitions involving change in basic infrastructure technologies, systems, and institutions are difficult to effect because new, embryonic systems must compete with established systems, often at a price disadvantage. The following are included: (1) summary and recommendations, (2) technology assessment and energy in the future, (3) hydrogen technologies, present and projected, (4) competing and complementing technologies, present and projected, (5) economics of hydrogen, (6) transition to a hydrogen economy, and (7) consequences of a hydrogen economy. Current research efforts and a computer analysis of foreign electrochemical traction battery technology utilizing various standardization and simulation techniques support the following ranking of foreign electric vehicle technology: United States, United Kingdom, Japan, Federal Republic of Germany, U S S R, France, Italy, and Sweden. All-electric vehicle systems (battery-battery or battery-fuel cells) are not presently competitive, on an energy or power density basis, with conventional, fossil-fueled, internal combustion engine systems. All-electric vehicle systems, however, offer an alternate or complementary mode of transportation in major metropolitan areas by reducing atmospheric pollution and fossil fuel consumption. Advanced

lead-acid, nickel-iron, and nickel-zinc traction batteries offer the greatest promise for urban transit vehicles (city buses, microbuses, and commuter cars). Commercial application of these electrochemical propulsion systems will receive considerable government and public support over the next 10 years in Europe, Japan, and the U S S R. High-energy electrochemical propulsion systems such as the sodium-sulfur, lithium-sulfur, and metal-air traction battery systems are theoretically promising. Actual utilization of these power sources in small military and domestic vehicles is anticipated by the late 1980s. GRA

The most attractive use of the Organic Rankine Cycle System (ORCS) is in large heavy-duty diesel trucks for long distance hauling. A conceptual design study of compounding the diesel truck engine with an ORCS was made. Based on the results of the conceptual design study which showed a 15 percent fuel economy improvement potential over the duty cycle, an early feasibility demonstration test of the system was initiated. The demonstration system used a Mack EMDT 676 diesel engine with existing but nonoptimum ORCS hardware made available from an earlier automotive Rankine cycle program. The results of these feasibility demonstration tests, both steady state and transient over the operating range of the diesel engine, are presented. ERA

HC A06/MF A01 CSCL 08I

The borehole hydraulic coal mining system accesses the coal seam through a hole drilled in the overburden. The mining device is lowered through the hole into the coal seam where it fragments the coal with high pressure water jets which pump it to the surface as a slurry by a jet pump located in the center of the mining device. The coal slurry is then injected into a pipeline for transport to the preparation plant. The system was analyzed for performance in the thick, shallow coal seams of Wyoming, and the steeply pitching seams of western Colorado. Considered were all the aspects of the mining operation for a 20-year mine life, producing 2,640,000 tons/yr. Effects on the environment and the cost of restoration, as well as concern for health and safety, were studied. Assumptions for design of the mine, the analytical method, and results of the analysis are detailed. Author

The problem addressed is if the United States had a reserve of petroleum of a given size to be used in case of an oil embargo, how should that petroleum be drawn from the reserve when an embargo actually occurs. The objective is to find a drawdown policy which maximizes the present value of total GNP benefits from petroleum drawn from the reserve minus the opportunity costs of holding the petroleum in storage. HC A05/MF A01 CSCL 08I

Factors traceable to the increasing shortfall in U S production of natural crude have rekindled interests in U S tar sands as a sources of synthetic fuel. Reported are the results of a preliminary study to assess the potential primary environmental impacts of production and processing of U S tar sands bitumen. With the possible exception attributable to chemical differences between tar sand bitumen and coal, potential environmental impacts of producing tar sands by mining methods would be similar in type to those of mining coal by the same method and in the same area as the tar sand deposit. Processes for extracting bitumen from the mined tar sand would generate solid waste in the form of spent sand. Constituents and quantities of emissions to air and water are process dependent but existing control technology and good environmental practices are technically applicable. A viable in situ production technology for producing tar sand reservoirs has not yet been demonstrated. On the basis of methods tested to date potential environmental impacts of producing tar sands by in situ methods would be very similar to those of conventional oil field production. Technical and economic factors will determine if in situ methods, or possibly underground methods, are an alternative to surface mining in environmentally sensitive areas. GRA

L W Hillen and D R Warren Jul 1976 47 p refs  
(ARL/Mech Eng-148) Copyright Avail Issuing Activity

The production of liquid hydrocarbon fuels from a non-depleting source such as solar energy and algae is investigated. The alga *Botryococcus braunii*, which grows widely in nature, can produce hydrocarbons in amounts up to 75% of its dry mass. There is considerable contemporary and geological evidence especially in Australia that it is capable of prolific growth under appropriate conditions. Harvesting and processing is relatively simple compared with other energy crops. Problems involved in producing solar oil in this way on a large scale are assessed. Author

Narrow elongated trenches, grouped together over a wide area, can be formed by bulldozer type equipment. Each trench is lined with a heat-absorbing black liner. The liquid in the bottom of each trench, used to absorb the solar energy, may be a brine solution or plain water depending on the means used to remove the thermal energy from the pond. The heat-absorbing liquid is kept separate from the thermal energy removing fluid by means such as clear polyethylene material. The covering for the pond may be a fluid or solid if the covering is a fluid fire fighting foam, continuously generated or siloons are used to keep the

surface covering clean and insulated. If the thermal energy removing fluid is a gas a fluid insulation layer contained in a flat polyethylene tubing is used to cover the pond. The side of the tube directed towards the sun is treated to block out ultraviolet radiation and trap infrared radiation. Author

(CONF-760842-14) Avail NTIS HC A02/MF A01

A solar air heating system incorporating a flat-plate air heater and packed bed thermal storage is described and a simulation model for the system is developed. The results of many simulations of the air heating system are used to establish the relationship between system performance and the system design and meteorological variables. The results are presented in analytic and graphical form, referred to as an f-chart for solar air heating systems. The results of simulations in several widely different climates suggest that the information presented in the f-chart is location independent. Methods of estimating the performance of air heating systems having a collector air capacitance rate and a storage capacity other than those used to generate the f-chart are included. ERA

(Contract EY-76-S-02-2858)

(COO-2858-1, Conf-760842-20) Avail NTIS HC A02/MF A01

The use of cooling storage in conjunction with lithium bromide adsorption chillers allows for improved operating conditions of

the cooling subsystem. Significant performance degradation in the absorption cooling capacity is evident whenever the chiller cycles are on and off during periods of low cooling demand. The capability of providing storage for the chiller output prevents short-term cycling of the absorption machine and significantly improves the seasonal average coefficient of performance of the cooling subsystems. Cool storage can also be utilized to allow for a lower cooling capacity of the absorption unit (lower tonnage), without decreasing the ability of the subsystem to meet the cooling demands of the building. **BIOSOLAR SYNFUELS FOR TRANSPORTATION**

Carl J Anderson 17 Jan 1977 17 p refs

(Contract W-7405-eng-48)

(UCRL-52208) Avail NTIS HC A02/MF A01

A short review is given of biosolar sources of synthetic liquid fuels (synfuels) for transportation. There are a variety of ways to convert potentially large energy crops into fuels suitable for transportation use, e.g., liquid fuels such as methanol, ethanol, and pyrolytic oils. In addition, organic wastes are widely produced, and although they are still generally not considered a resource, there is little doubt that they will increasingly be recycled for their material and energy value. Major technical, social, economic, environmental, and political questions remain, and although the potential for biosolar transportation synfuels is large, it is still small compared to transportation energy demand. Because of their costs, early implementation of biosolar conversion schemes will likely not be in the area of transportation synfuels. ERA

**HYDROGEN-VIA-ELECTRICITY: A CANDIDATE TRANSITIONAL TRANSPORTATION ENERGY SYSTEM CONCEPT**

W J D Escher Sep 1976 89 p refs

(ERDA-77-13, TEC-77/001, PT-67)

Avail NTIS

HC A05/MF A01

There is an expressed need to move transportation off oil. However, the strategic alternatives for creating a nonpetroleum energy base for transportation are all long-term, extremely costly systems (hydrocarbon synfuels, electricity, hydrogen energy), each having technical and socio-economic limitations and constraints which will govern their relative contributions. To preserve the options while conducting positive steps to obviate the possibility of energy shortfalls affecting transportation in the meanwhile, a transitional transportation energy systems approach may be needed. A candidate concept Hydrogen-via-Electricity (HVE) is described in terms of criteria for such a system, and also related to each of the strategic alternatives to establish compatibility. If implemented, the HVE Concept has the near-term potential for supporting a certain fraction of the energy needs of the following transportation subsectors: railroads, intercity trucking, urban and intercity buses, and selected fleet vehicle systems. **BRIEFING BOOK ON THE ENERGY SITUATION IN NEW ENGLAND**

Joel P. Brainard, James S. Munson, and Philip F. Palmedo Oct 1976 138 p refs  
 (Contract EY-76-C-02-0016)  
 (BNL-21918) Avail NTIS HC A07/MF A01

This briefing book is designed to give a concise overview of the facts of the energy situation in New England and of attitudes within the region towards current energy issues. Many of the central problems of U.S. energy policy are manifested in the region in a magnified form. The region entered the period of energy shortages and increasing prices in an economically declining condition. Energy prices were already high in 1970, 30% higher than rest of the country; the difference increased to 38% by 1974. With essentially no indigenous energy resources, New England is an energy-importing region. For various reasons it is also more dependent on petroleum than other regions of the country and, at the same time, distant from domestic petroleum-producing regions. The result is that over 60% of the fuels it consumes are also imported from abroad. Although the future supply of energy to the region is critically dependent on energy-resource policies, policies related for example to coal and oil shale development, the region's concerns cluster around policies and technologies that are perceived to have a more direct impact on its energy welfare. Thus energy conservation, solar energy, nuclear power, offshore oil development and, in general, the price of energy to the region are paramount issues of concern and debate. Following the introductory chapter, these issues are discussed in four additional chapters: The Energy Situation in New England, Regional Energy Issues, Energy-Related Institutions, and State Legislation. A conceptual design of an electric storage system has been developed. Break-even cost data for introducing electric storage devices into the national energy system have been developed. Six materials were evaluated as substitutes for asbestos in the alkaline cell for use in 20 to 30 percent KOH at 150 to 160 C. Three of these look promising. Tests were conducted on the largest hydride test bed (84 lb granular FeTi) to determine the length of time various flow rates could be sustained in the Hydrogen Technology Advanced Components Test System, design specifications and cost goals based on small-scale tests and analysis have been established for the storage components. Design specifications and cost goals have also been established for electrolyzer components. Several compositions of the TiFe/sub y/Mn/sub z/H/sub x type were investigated. These compositions show greatly reduced dissociation and association pressures which subsequently may reduce the electrolysis unit and hydride storage vessel costs. ERA

**SOLAR ENERGY AND ELECTRIC UTILITIES: CAN THEY BE INTERFACED?**

Joseph G. Asbury and Ronald O. Mueller Aug 1976 35 p refs  
 (Contract W-31-109-eng-38)  
 (ANL/ES-52) Avail NTIS HC A03/MF A01

The economics of solar systems that interface with electricity supply systems are discussed. First, adopting the implicit assumption of many solar system designers of abundant supplies of low-cost off-peak electricity, systems studies of several of the more important solar energy applications are presented. It is shown that much of the electricity supply savings claimed for solar energy systems stem from the storage, rather than the solar, component of the system. Second, employing a standard economic representation of the periodic load problem, the general problem of interfacing solar energy and electric utility supply systems is examined. The general conclusion is that solar energy systems and conventional electric utility systems represent a poor technological match. The basic problem is that both technologies are very capital intensive. ERA

The rapidly increasing energy demand has brought increased emphasis on the conversion of coal and oil shale to fluid fuels. These solid fuels provide a significantly greater pollution potential than petroleum. For the conversion program to be successful, effort must be directed toward the establishment of meaningful emissions standards. Yet meaningful regulations cannot be established for these processes without reliable emission stream data that are not now available. While the need for stream composition data is widely recognized, the complexity of the technology and the absence of representative equipment combined with the need for complex sampling and analytical procedures have limited progress in data acquisition. The possibility of altering the oil and gas supply models to utilize more complex investment and production profiles, especially in frontier oil and gas provinces is investigated. The assumptions used in the models with respect to timing of investment and production are acceptable for mature oil and gas provinces, but are less so for frontier production areas. Investment leadtimes and rates of production build-up are slower in virgin provinces, which leads to underpriced petroleum and overestimated production in these areas. GRA

This study assesses the potential market for solar domestic hot water systems in DOD bachelor enlisted and bachelor officer quarters (barracks). The number and locations of existing and planned bachelor enlisted and bachelor officer quarters in the United States are analyzed, and the locations where solar domestic water heating is most feasible are determined. Life-cycle costs of providing solar domestic water heating systems are analyzed and the DOD market potential for these systems determined for varying system costs. The results of more than 120 one-year solar hot water heating system simulations are presented along with a dimensionless graph and methodology which can be used to estimate solar hot water heater performance for building loads and sites other than those studied. The potential markets for solar collectors based on varying system costs are presented. Results indicate that at an anticipated future system cost of \$9/sq ft (\$97/sq m) of collector the probable market for solar collectors is 4.4 million sq ft (409,000 sq m). Over a 20-year life, the potential savings resulting from application of this collector area is estimated to be 4.5 million barrels of fuel and \$29 million. Author (GRA)

A high temperature reflectometer was used to determine the high temperature performance of selective surfaces. The specular reflectance for nine samples of the absorber-reflector-tandem type with absorber layers of  $ZrC(x)N(y)$  was obtained for temperatures up to 700C in some cases. A diffuse reflectometer of the integrating sphere type was used to characterize several samples that used fine grain texturing to enhance solar absorption. Specular reflectance measurements for such samples are unreliable because of the large fraction of light that is scattered out of the beam. During the final quarter, stainless steel substrates were coated with chemical vapor deposited molybdenum. Although these sample coatings did not have infrared reflectance as high as expected from previously obtained data, they will be useful for initial stability tests with the Bureau of Mines absorbers. D I Tchernev 1 Feb 1977 99 p  
(Grant NSF AER-74-09038)  
(PB-266055/3, NSF/RA-770017) Avail NTIS  
HC A05/MF A01 CSCL 13A

The usefulness of molecular sieve zeolites for solar sorption heating and cooling has been investigated. Two different approaches have been used: one in which the temperature of the zeolite is uniform, the other in which a temperature gradient is established across the zeolite. With one-square-foot test panels using the uniform temperature approach, overall engineering efficiencies as high as 75% for heating with a condenser temperature of 60C (140F) were obtained. Cooling efficiencies as high as 45% were obtained for a condenser temperature of 50C (120F), the maximum temperature expected for an air-cooled condenser. GRA

Mathematical models developed to study the effects on air quality of using high-sulfur fuels in power plants are described. The Reactive Plume Model (RPF), adopting a trajectory approach, accommodates variations in wind speed, plume spread, and ambient concentrations. The Buoyant Plume Model (BPM) predicts plume rise and effluent dispersion near the stack. It invokes the Navier-Stokes equation with the Boussinesq approximation, and allows for plume-generated turbulent diffusion. The Plume Dispersion Model (PDM) simulates pollutant distributions far downwind. PDM solves the three-dimensional atmospheric diffusion equation, and incorporates variations in wind speeds. GRA

The report describes and compares current projects sponsored by EPA and the U.S. Energy Research and Development Administration (ERDA), relating to the control of particulate matter in fuel gas streams at high temperatures (1000 to 2000 F) and high pressures (5 atm and greater). The descriptions document each project and provide a narrative statement of objectives and technology involved. Project descriptions provide bases for identifying overlap or duplication, and indicate areas not addressed by either Agency. Comparison of EPA and ERDA activities for possible overlap and omissions is summarized in the conclusions, which indicate that there is little evidence of any overlap or

duplication No projects are dedicated exclusively to characterization and study of aerosol mechanics, however, one such EPA-sponsored study was completed recently Some characterization work is done at ERDA, incident to advanced energy systems development Development of instrumentation is limited and does not extend to the expected 1000-psig operating range GRA

Jan 1977 35 p refs  
(Contract N00014-76-C-0410, NR Proj 099-412)  
(AD-A036452) Avail NTIS HC A03/MF A01 CSCL 20/9

Two-phase Hartmann flows in an MHD generator duct of rectangular cross-section are examined and numerical values for the velocity fields and induced current streamlines for fluids of spatially-dependent electrical conductivity are determined as a function of load factor, Hartmann number and channel aspect ratio This study is of considerable practical interest in connection with some experimental work on two phase liquid metal-gas MHD generators and the results presented herein may enhance the understanding of the operating characteristics of such devices Results indicate that conductivity gradients can produce inflected velocity profiles which may be hydrodynamically unstable, that for larger load factors the shunt current in the Hartmann boundary layers become considerable and that two-phase MHD flows of moderate void fractions have sound speeds considerably lower than in its components Turbulent effects are not considered in these studies since turbulent fluctuations are expected to be suppressed for the high Hartmann number flows of interest in two-phase MHD generators GRA

**ASSESSMENT OF THE ROLE OF THE LIQUEFIED PETROLEUM GAS (LPG) ENGINE IN STAGE CARRIAGE SERVICE VEHICLES**

G G Lucas Jul 1976 37 p refs  
 (TT-7605) Avail NTIS HC A03/MF A01

An assessment has been made into the viability of replacing the usual diesel engine in a public service vehicle with a spark ignition engine designed to operate on liquefied petroleum gas (LPG). The advantages of the LPG engine are less smoke, less noise, less odor, greater power for acceleration and less initial cost. The disadvantages are an increased fuel consumption in terms of miles per gallon and slightly higher emissions of carbon monoxide and unburnt hydrocarbons. The former may be alleviated however if the cost of LPG to the consumer is proportionately less than that of diesel fuel. In this the excise duty and rebate system is very important. The availability of LPG is good at present and is expected to increase over the next ten years. Author (ESA)

**DRAG REDUCTION IN COCURRENT HORIZONTAL NATURAL GAS-HEXANE PIPE FLOW** Ph D Thesis

Russell Hugh Dowling 1976 144 p  
 Avail Univ Microfilms Order No 77-6689

The drag reduction and degradation characteristics were studied as a function of pipe diameter, gas flow rate, liquid flow rate and additive concentration for the Conoco CDR and Shell PEP-4 polymers and the Dowell APE micellar type formulation. It was found that drag reduction behavior in annular-mist flow was analogous to single-phase liquid flow. Increasing friction velocity resulted in decreasing levels of drag reduction, and higher concentrations gave higher drag reductions. Furthermore, as the liquid/gas ratio increased so did the level of drag reduction up to 34% drag reduction was observed for the Dowell APE formulation at the highest liquid rates, whereas drag increases were found for liquid/gas ratios on the order of 10 B/MMscf or less. Drag reduction in two-phase annular-mist flow, which is limited to the contribution of the liquid phase to the overall two-phase pressure drop, was shown to depend on pipe size as well as liquid/gas ratio. HC A07/MF A01 CSCL 20D

A heat pipe was designed for operation in the 100 - 200 K temperature range with maximum heat transport as a primary design goal, another designed for operation in the 15 - 100 K temperature range with maximum flexibility as a design goal. Optimum geometry and materials for the container and wicking systems were determined. The high power (100 - 200 K) heat pipe was tested with methane at 100 - 140 K, and test data indicated only partial priming with a performance limit of less than 50 percent of theoretical. A series of tests were conducted with ammonia at approximately 280 K to determine the performance under varying fluid charge and test conditions. The low temperature heat pipe was tested with oxygen at 85 - 95 K and with methanol at 295 - 315 K. Performance of the low temperature heat pipe was below theoretical predictions. Results of the completed testing are presented and possible performance limitation mechanisms are discussed. The lower-than-expected performance was felt to be due to small traces of non-condensable gases which prevented the composite wick from priming. Author

This paper summarizes the power conditioning portion of the high power study that was performed for the Air Force Aero-Propulsion Laboratory by the State University of New York at Buffalo This effort defines the power conditioning system and critical component developments which will be required to interface the airborne 10 MW to 50 MW sources defined under separate study efforts with certain loads Power conditioning systems are considered for use with magnetohydrodynamic generators and turbine driven alternators, both conventional and superconducting The critical components required for each of the power conditioning systems are identified and then analyzed The component analyses include estimations of development efforts necessary and of specific weights and volumes of components The primary components considered are transformers (for alternator as well as for inverter use), switches, capacitors and inductors Weight algorithms are developed for each of the components Following the component analyses, subsystems such

as inverters and rectifier and filter packages are considered. The data for the various components and subsystems are then utilized for a comparison of the power conditioning techniques to be used with the various power sources. The weights and volumes of power conditioning systems for 8 point designs (8 variations of power, voltage, duty cycle and total run time) are derived. Finally, a development program is outlined for the critical components and subsystems. Author (GRA)

Oct 1976 170 p refs Sponsored in part by NBS Experimental Technology Incentives Program  
 (PB-266043/9) Avail NTIS HC A08/MF A01 CSCL 13A

The technical feasibility and the economic benefits of an Integrated Utility System (IUS) at the University of Florida are addressed, as are the environmental and institutional factors. The recommended IUS alternates include select energy systems wherein one fourth to three fourths of the required electrical power is generated on-site with full utilization of the waste heat from the process for heating and cooling purposes. Full integration of the systems is achieved through incineration of solid waste for its heat content, and partial reuse of the effluent from the existing sewage treatment plant for equipment make-up water and for irrigation.  HC A06/MF A01 CSCL 10B

A design has evolved from an earlier space cell which is promising for large scale terrestrial use. This is a front wall cell.

on zinc plated copper foil substrate with an evaporated grid and an integral glass cover formed by rf sputtering. This cell is suitable for low cost mass fabrication. Though it has not been fully proven it combines the constructional features that showed maximum stability in operation in the past. A standard process laboratory line was operated with fixed process parameters for 14 months. Over this period cell efficiency averaged 4.9% with an 81% yield. Earlier space cells were encapsulated to protect them from the atmosphere and subjected to accelerated life tests. They showed no loss of output after 20 months of 50% daily duty cycles at operating temperatures of 40C, 60C, and 80C. Cells operated at 100C showed an 11% loss of output over the 20 months of accelerated use which is attributed to diffusion of copper from the Cu<sub>2</sub>S into the CdS. GRA

The state-of-the-art is reviewed relative to development, capacity, and adequacy of the heat pump as a potential replacement for outmodded fossil-fueled heating and cooling systems in the residential and commercial sector. Projections are made of the rate at which heat pumps need to be manufactured and installed in the commercial and residential sectors as the projected service life of fossil-fuel equipment expires. The conclusion is reached that the heat pump is economical only as a total space comfort system. Based on January 1, 1976, fuel prices, the heat pump is about 25% more expensive to operate than comparable fossil-fuel heating systems. If the trend of increasing fuel prices continues, the heat pump will be more economical to operate than comparable fossil-fueled heating systems by 1980. GRA

The identification of health and ecological impacts of using coal for generating electrical power requires an understanding of the entire coal cycle, which can be described chronologically as extraction - processing - transportation - combustion - waste. Each segment of the cycle is described, with emphasis placed on those topics where potential health and ecological impacts may occur. Underground and surface mining, coal processing, and transportation including rail, barge, slurry pipeline, truck, and conveyor are described. The combustion, combustion wastes, and airborne combustion emissions are predicted for a model 1000-MWe coal-fired power plant. The description of this plant includes ancillary structures, daily and annual fuel requirements assuming a 70% capacity factor, coal storage piles, and wastes generated. GRA

**AN EXPERIMENTAL STUDY SUPPORTED BY A COMPUTER SIMULATION IN A PRECHAMBER CFR DIESEL ENGINE LEADING TO A MODIFIED CETANE SCALE FOR RATING LOW IGNITION QUALITY FUELS** Ph.D Thesis

Nabil Youssef Elias 1976 319 p

Avail Univ Microfilms Order No 77-9392

The current ASTM cetane scale was investigated as a criterion to rate low ignition quality diesel fuels. An evaluation of the effect of raising compression ratio on gas temperature indicated that while the increase in compression ratio beyond a critical ratio greatly affects the pressure, it has an insignificant effect on gas temperature. A study of the effect of gas pressure and temperature on ignition delay period showed that the effect of increasing the gas temperature on ignition delay was much more than the effect of increasing the gas pressure. It was concluded that raising compression ratio does not extend the current cetane scale for C/N below 15. Dissert Abstr

This report examines short- and long-term measures to reduce the consumption of petroleum jet fuels by the Air Force. Engine retrofits and aerodynamic modifications to existing aircraft can save significant quantities of jet fuel, however, savings in fuel expenditures are not enough to offset high initial costs of engine retrofits. If accomplished early in an aircraft's life cycle, relatively lower costs of modest aerodynamic modifications may be recoverable through savings in fuel expenditures. Synthetic JP fuels derived from oil shale or coal appear to be the most attractive future alternatives to petroleum jet fuels. If the foreign oil cartel maintains its price-setting effectiveness and synthetic fuels industry develops in the United States, development of an Air Force capability to interchangeable use fuels derived from crude oil, oil shale, or coal could be economically attractive and enhance the Air Force's position in the jet fuel marketplace.

Walter B Bienert Amon S Ducao, and Donald S Trimmer 6 May 1977 55 p refs  
 (Contract NAS2-9233)  
 (NASA-CR-152015, DTM-77-2) Avail NTIS  
 HC A04/MF A01 CSCL 20D

The development of a jet pump assisted arterial heat pipe is described. The concept utilizes a built-in capillary driven jet pump to remove vapor and gas from the artery and to prime it. The continuous pumping action also prevents depriming during operation of the heat pipe. The concept is applicable to fixed conductance and gas loaded variable conductance heat pipes. A theoretical model for the jet pump assisted arterial heat pipe is presented. The model was used to design a prototype for laboratory demonstration. The 1.2 m long heat pipe was designed to transport 500 watts and to prime at an adverse elevation of up to 1.3 cm. The test results were in good agreement with the theoretical predictions. The heat pipe carried as much as 540 watts and was able to prime up to 1.9 cm. Introduction of a considerable amount of noncondensable gas had no adverse effect on the priming capability. Author

**SENSITIVITY OF SOLAR CELL PERFORMANCE TO ATMOSPHERIC VARIABLES 1 SINGLE CELL**

Thomas M Klucher *In its* Terrest Photovoltaic Meas 2 1976 p 247-258 refs

The short circuit current of a typical silicon solar cell under direct solar radiation was measured for a range of turbidity, water vapor content, and air mass to determine the relation of the solar cell calibration value (current-to-intensity ratio) to those atmospheric variables. A previously developed regression equation was modified to describe the relation between calibration value, turbidity, water vapor content, and air mass. Based on the value of the constants obtained by a least squares fit of the data to the equation, it was found that turbidity lowers the value, while increase in water vapor increases the calibration value. Cell calibration values exhibited a change of about 6% over the range of atmospheric conditions experienced. Author

**SILICON SOLAR CELL TESTING IN CONCENTRATED SUNLIGHT AND SIMULATED SUNLIGHT**

E L Burgess and K W Mitchell *In NASA* Lewis Res Center Terrest Photovoltaic Meas 2 1976 p 337-354 refs Sponsored by ERDA

Avail NTIS HC A17/MF A01 CSCL 10A

A method is described for testing silicon solar cells in concentrated sunlight and simulated sunlight. Concentrated sunlight is obtained by using an acrylic Fresnel lens. The simulated sunlight source is a short arc Xenon lamp. Average illumination levels during the tests are inferred from an assumed linear relationship between short circuit current and illumination. The linearity assumption is investigated for 0.3 alpha cm base resistivity silicon cells and found to be valid. Some typical results are presented to illustrate the type of information obtained during the testing. Author

Photolineaments from stereoscopic examination of vertical aerial photographs and those found by the Ronchi grating study of aerial photoindex sheets are described and discussed. They are compared with the trends of oriented fracture systems procured by measuring the compass direction of joints in bedrock. The relative reliability of the methods is shown, and the results are presented in graphical, tabular and written form. Analyses of field measurements of strikes of bedrock joints in the project area indicate for the most part two intersecting sets of major joints oriented N 76 degrees W - N 15 degrees E and N 57 degrees W - N 27 degrees E. The analyses of lineaments determined by stereoscopic examination of aerial photographs show dominant trends of lineament zones of weakness to be an average on N 65 degrees W - N 20 degrees E. Analysis of lineaments found by Ronchi grid viewing of aerial photoindex sheets indicate dominant trends of N 70 degrees W - N 27 degrees E. GRA

 (NASA-TM-73515 E-8596) Avail NTIS HC A99/MF A01 CSCL 10B

Advanced systems using coal and coal-derived fuels for base-load electric power generation were compared. The study

was conducted in two phases. Phase 1 consisted of a parametric analysis. From these results 11 concepts were selected for further study in Phase 2. For each of the Phase 2 systems and a common set of ground rules, the performance, cost, environmental intrusion, and natural resource requirements were estimated. In addition, the contractors defined the state of technology, identified advances required, and prepared preliminary research and development plans and an implementation assessment. The systems studied in Phase 2 include steam systems with atmospheric- and pressurized-fluidized-bed boilers combined gas turbine/steam systems with integrated gasifiers or fired by a semiclean coal-derived fuel, a potassium/steam system with a pressurized-fluidized-bed boiler, a closed-cycle gas turbine/organic system with a high-temperature, atmospheric-fluidized-bed furnace, a direct-coal-fired open-cycle magnetohydrodynamic/steam system, and a molten carbonate fuel cell/steam system with integrated gasifier. The Phase 2 results are summarized and compared and presented together with NASA analysis and evaluation. The common ground rules specified for the study are presented. The sensitivity of the results to changes in the ground rules and the impact of uncertainties in capital cost estimates are examined. Author

**DYNAMIC BLADE LOADING IN THE ERDA/NASA 100 kW  
AND 200 kW WIND TURBINES**

D. A. Spera, D. C. Janetzke, and T. R. Richards. Aug 1977. 16 p. refs. Presented at the Natl Conf of the Am Wind Energy Assoc, Boulder, Colo., 11-14 May 1977. (Contract E(49-26)-1004). (NASA-TM-73711, ERDA/NASA-1004-77/2 E-9242). Avail NTIS HC A02/MF A01 CSCL 10A.

Dynamic blade loads, including aerodynamic, gravitational, and inertial effects, are presented for two large horizontal-axis wind turbines: the ERDA-NASA 100 kW Mod-0 and 200 kW Mod-0A wind power systems. Calculated and measured loads are compared for an experimental Mod-0 machine in operation. Predicted blade loads are also given for the higher power Mod-0A wind turbine now being assembled for operation as part of a municipal power plant. Two major structural modifications have been made to the Mod-0 wind turbine for the purpose of reducing blade loads. A stairway within the truss tower was removed to reduce the impulsive aerodynamic loading caused by the tower wake on the downwind rotor blades. Also, the torsional stiffness of the yaw drive mechanism connecting the turbine nacelle to the tower was doubled to reduce rotor-tower interaction loads. Measured reductions in load obtained by means of these two modifications equaled or exceeded predictions. Author

A completed preliminary survey of silica sources indicates that sufficient quantities of high-purity quartz are available in the U.S. and Canada to meet goals. Supply can easily meet demand for this little-sought commodity. Charcoal, as a reductant for silica, can be purified to a sufficient level by high-temperature fluorocarbon treatment and vacuum processing. High-temperature treatment causes partial graphitization which can lead to difficulty in smelting. Smelting of Arkansas quartz and purified charcoal produced kilogram quantities of silicon having impurity levels generally much lower than in MG-Si. Half of the goal was met of increasing the boron resistivity from 0.03 ohm-cm in metallurgical silicon to 0.3 ohm-cm in solar silicon. A cost analysis of the solidification process indicates \$350-725/kg Si for the Czochralski-type process and \$150-425/kg Si for the Bridgman-type technique. Author

 (NASA-TP-1005, M-224) Avail NTIS HC A05/MF A01 CSCL 10A

Line-focusing acrylic Fresnel lenses with application potential in the 200 to 370 C range are being analytically and experimentally evaluated. Investigations previously conducted with a 56 cm wide lens have been extended by the present study to experimentation/analyses with a 1.8 by 3.7 m lens. A measured peak concentration ratio of 64 with 90 percent of the transmitted energy focused into a 5.0 cm width was achieved. A peak concentration of 61 and a 90 percent target width of 4.5 cm were analytically computed. The experimental and analytical lens transmittance was 81 percent and 86 percent, respectively. The lens also was interfaced with a receiver assembly and operated in the collection mode. The collection efficiency ranged from 42 percent at 100 C to 26 percent at 300 C. Author

**OPTIMIZATION OF PLATINUM-DOPED KOCITE ELECTRODES IN H3PO4 FUEL CELLS Interim Progress Report, Sep - Dec 1976**

L B Welsh and R W Leyerle Mar 1977 88 p refs  
 (Contract DAAG53-76-C-0014, DA Proj 1G7-62708-AH-78)  
 (AD-A039242 IPR-3) Avail NTIS HC A05/MF A01 CSCL 09/1

The use of UOP platinum impregnated Kocite materials as low-cost air and/or fuel electrocatalysts in phosphoric acid electrolyte fuel cells has been optimized with respect to some of the electrocatalyst and electrode structure parameters. Kocite materials are composite structures consisting of pyropolymers chemically bonded to refractory substrates. Fuel cell electrodes were fabricated from these materials and tested as anodes or cathodes in model fuel cells with Teflon-bonded platinum-black counter electrodes. GRA

**SAVINGS IN ENERGY CONSUMPTION BY RESIDENTIAL HEAT PUMPS. THE EFFECTS OF LOWER INDOOR TEMPERATURES AND OF NIGHT SETBACK**

R D Ellison Jan 1977 32 p refs  
 (Contracts W-7405-eng-26, FEA-CG-04-75-012-0)  
 (ORNL/CQN-4) Avail NTIS HC A03/MF A01

The energy saving potential of reduced indoor temperatures and of night setback is examined for residential heat pumps. A computer program was used to calculate heating loads to modify and to evaluate the heating capacity, energy consumption, and running time of heat pumps on an hourly basis as a function of outdoor dry bulb temperature and to simulate the use and energy consumption of auxiliary resistance heaters. Annual heating loads,

## N77-30629

energy consumption percentage savings and seasonal COP's. Coefficients of performance are presented for several indoor temperature regimes and a variety of climatic conditions. Hourly profiles of these quantities give some insight into the energy savings found. ERA

#### **DEMONSTRATION OF BUILDING HEATING WITH A HEAT PUMP USING THERMAL EFFLUENT Special Report**

Peter W. Sector May 1977 30 p refs  
(AD-A041024, CRREL-SR-77-11) Avail NTIS  
HC A03/MF A01 CSCL 13/1

This report describes efforts made to recover waste heat and to reuse it to heat a building. A heat pump, which is a refrigeration device, was operated to provide building heat and to demonstrate both economic benefits and energy savings possible with this type of heating system. Heat pump fundamentals and system design considerations supplement the report of this demonstration project. Operational characteristics were monitored and are reported. A 25% reduction in heating costs was observed compared with an oil-fired system. The author recommends that the minimum coefficient of performance should be 3.4 for a cost effective energy-conservative heat pump heating system. Author (GRA)

### N77-30632# Colorado Springs Dept of Public Utilities, Colo **ASSESSMENT OF A SINGLE-FAMILY RESIDENCE SOLAR HEATING SYSTEM IN A SUBURBAN DEVELOPMENT SETTING PROJECT PHOENIX Final Report, 1 Jul 1974 - 1 Jul 1976**

(PB-266836/6, FEA/T-77/177) Avail NTIS  
HC A02/MF A01 CSCL 21D

Energy consumption rate in the United States is evaluated. Even with sharp increases in energy prices following the Arab embargo, the use of energy per dollar GNP has remained relatively stable. Domestic oil production, which has been declining since 1970, will continue to do so but at a rate less than that experienced prior to the 1973-1974 embargo. Production will stabilize and then increase in the next few years as approximately 1.6 million barrels per day of Alaskan oil is transported to the lower 48 states. GRA

James S Mattson Mar 1976 49 p refs

(Contract DOT-CG-81-75-1364)

(AD-A039387 USCG-D-6-77) Avail NTIS HC A03/MF A01 CSCL 11/8

The classification of multicomponent petroleum oils (crude oils lubricants distillate and residual fuels) solely by their infrared absorption spectra is a difficult task Crude oils alone include a phenomenal variety of systems, from heavy asphaltic crudes to light crudes that are similar to a No 2 fuel oil Furthermore the distinctions between classes of fuel oils (i.e Nos 1 2 4 5 and 6 fuels) are based upon ASTM specifications for continuous properties such as flash point and viscosity In South Florida for example local fuel oil suppliers meet requests for Nos 4 or 5 fuel oils by blending together appropriate proportions of Nos 2 and 6 fuels In order to reduce the amount of sampling required in the event of an oil pollution incident it would be useful to be able to initially classify the pollution sample into one of the above groups Infrared spectroscopy has been promoted as a useful analytical technique for oil classification and identifications, since it does provide some information on the aliphatic aromatic polynuclear aromatic carbonyl and organosulfur composition of an oil Infrared spectra have been used in previous efforts to distinguish asphalts from residual fuels and to provide a tool for 'fingerprinting' oils Kawahara et al applied linear discriminant function analysis (LDFA) to their infrared data to make the binary distinction between asphalts and residual fuels Author (GRA)

### **CHROMATOGRAPHIC DETERMINATION OF ADSORPTION AND DIFFUSION IN A BIDISPERSED POROUS SOLID**

P G Boisvert and E E Petersen Sep 1976 116 p refs

(Contract W-7405-eng-48)

(LBL-5273) Avail NTIS HC A06/MF A01

Mass transfer within a well defined bidispersed solid structurally similar to coal, namely 5A molecular sieves, was studied. The diffusion and adsorption of nitrogen, argon, and carbon dioxide were studied using a chromatographic technique. A monodispersed pore model was used to describe the bidispersed pore system of the 5A molecular sieve. This model was an accurate representation of the 5A pore system since negligible mass transfer resistance was measured in the micropores. Much larger solid-adsorbate interactions occur with carbon dioxide than with argon or nitrogen possibly due to the higher polarizability and linear molecular geometry of carbon dioxide. Extrapolation of these results to coal suggests that highly polar solvents may exhibit better penetrability into coal due to the higher surface interactions. This should yield more efficient coal liquefaction processes by increasing the amount of internal surface area contacted by the solvent. ERA

### **AN EVALUATION OF VERY LARGE AIRPLANES AND ALTERNATIVE FUELS Interim Report**

W T Mikolowsky, L W Noggle, W F Hederman, and R E Horvath Dec 1976 401 p refs

(Contract F49620-77-C-0023)

(AD-A040532, R-1889-AF) Avail NTIS HC A18/MF A01 CSDL 01/3

Very large airplanes using alternative fuels are examined in the context of existing and possible future Air Force missions. Synthetic jet fuel (JP), liquid methane, liquid hydrogen, and nuclear propulsion are the fuel alternatives selected for detailed analysis. Conceptual designs of airplanes using each of these fuels were developed and estimates were made of their life-cycle cost and life-cycle energy consumption. Mission analyses were performed to determine the effectiveness of the alternative airplanes in strategic airlift specifically and in the station-keeping role in general. Results indicate that for most military applications airplanes with gross weights in excess of one million pounds promise to be superior to any contemporary airplanes in terms of cost-effectiveness and energy-hydrocarbon jet fuel, whether manufactured from oil shale, coal or crude oil, remains the most attractive aviation fuel for future Air Force use. Policy recommendations are made pertaining both to alternative fuels and to advanced-technology large airplanes. Future research and developments are also identified. Author (GRA)

### **TECHNOECONOMIC ANALYSIS OF LARGE SCALE THERMONUCLEAR PRODUCTION OF HYDROGEN Final Report**

James E Funk Dec 1976 180 p refs Prepared in cooperation with CE-Lummus, Bloomfield, N.J (EPRI Proj 467)

(EPRI-EM-287) Avail NTIS HC A09/MF A01

Capital and operating costs and overall process efficiency are presented for a four-reaction thermochemical process which produces hydrogen from water. These results were obtained from a detailed preliminary plant design which was made after the selection of a suitable process and the establishment of a design basis. Selection of an appropriate process involved the evaluation of estimated process efficiency, materials problems, and availability of data for known thermochemical cycles. This initial screening resulted in the identification of four cycles which appeared promising in terms of low cost and efficient hydrogen production. A more detailed analysis of these four cycles included the preparation of mass and energy balances including the interface with the nuclear heat source and the specification of separation techniques, operating conditions, etc. Process thermal efficiency was re-estimated and the problems involved in the design of a large-scale plant were evaluated in more detail. **HEAT-PIPE BISMUTH LASER: EXAMINATION OF LASER ACTION AT 4722 Å IN BISMUTH VAPOR Final Report, 1 May 1973 - 31 Jan 1976**

William T Walter and Nicholas Solimene Nov 1976 69 p refs

(Contract N00014-67-A-0438-0015)

(AD-A039568, POLY-EE/EP-76-022)

Avail NTIS

HC A04/MF A01 CSCL 20/5

The possibility of producing efficient pulsed laser action at 4722 Å in the neutral atomic vapor of bismuth has been examined. The presence of a substantial fraction of dimers ( $\text{Bi}_2$  molecules) in the vapor of bismuth could prevent laser action by absorption of the 3067 Å Bi resonance line. This would not only reduce radiation trapping but would also produce dissociation of the dimers leaving one Bi atom in a metastable proposed lower laser level. Heat pipes were used to create a two temperature zone apparatus and thermally dissociate bismuth dimers. Double-pulses were used to produce discharge dissociation of bismuth dimers. The pressure and composition of bismuth vapor has been critically evaluated. A radial discharge was used to reduce the risetime of the excitation current pulse to approximately 25 nsec which is much shorter than the reciprocal of 5,300,000 sec, the best value for the 4722 Å transition probability. Absence of laser action at 4722 Å is believed due to competing processes within the bismuth atom. GRA

J R Alldredge and D D Bolstad 1977 63 p refs

(PB-266762/4 BM-IC-8731) Avail NTIS HC A04/MF A01 CSCL 08G

A computer code has been developed for describing and testing the statistical distribution of general continuous data sets. The statistical distributions used include the normal, lognormal, exponential, chi square, gamma, and uniform. Histograms for observed and expected values are plotted for each distribution. An example using geologic data obtained from a study of the geometric properties of natural fractures in oil shale rock illustrates the use of the computer program, GDIST. GRA

**A SCREENING FOR POTENTIALLY CRITICAL MATERIALS FOR THE NATIONAL STOCKPILE**

1977 67 p refs Sponsored in part by Bureau of Mines and Dept of Commerce  
(Contract GS-00-DS(P)-94008)  
(PB-267214/5, NMAB-329) Avail NTIS HC A04/MF A01  
CSCL 081

Inorganic and organic source materials were reviewed in an attempt to identify potentially indispensable materials. Primary criticality was based upon short-term stockpiling needs other aspects such as the impact of new energy developments, alternate sources, alternate materials or design, and conservation were considered. Surprisingly few additional materials could be identified clearly as being critical on a worldwide basis however, after screening a broad spectrum of source materials, chromium, germanium, iridium, rhenium, vanadium, and zirconium and hafnium were identified for a more detailed examination. Of these commodities, chromium stands out in importance on the basis of criticality. GRA

10A

A solar cell shingle was made of an array of solar cells on a lower portion of a substantially rectangular shingle substrate made of fiberglass cloth or the like. The solar cells may be encapsulated in fluorinated ethylene propylene or some other weatherproof translucent or transparent encapsulant to form a combined electrical module and a roof shingle. The interconnected solar cells were connected to connectors at the edge of the substrate through a connection to a common electrical bus or busses. An overlap area was arranged to receive the overlap of a cooperating similar shingle so that the cell portion of the cooperating shingle may overlie the overlap area of the roof shingle. Accordingly, the same shingle serves the double function of an ordinary roof shingle which may be applied in the usual way and an array of cooperating solar cells from which electrical energy may be collected.

**A NON-AEROSPACE APPLICATION OF PLANS: PRE-LIMINARY STRUCTURAL DESIGN OF WIND TURBINE DIFFUSER**

J Crouzet-Pascal Mar 1977 88 p refs  
(Contract E(11)-2616)  
(RM-629) Avail NTIS HC A05/MF A01

A baseline design for a lightweight diffuser, its calculated weight, and the method employed to calculate the specific sizes in the design are described. Formulas are presented that permit the straightforward assessment of the effect on the diffuser weight, and the related cost of power generation, of changes in dimensions, material, or allowable deflections. It was established that for a scale variation in the over-all size of the diffuser, the cost of

power generation attributable to the diffuser varies linearly with the diffuser front radius. It was also established that as compared to using aluminum, the cost would actually go up with standard strength steel but down with higher strength steel. Allowing the structure to be more flexible cannot yield a reduction in cost unless a change in material properties is allowed. Author

CSCL 21D

Measurements on the solid electrolyte cell ( $\text{Ar} + \text{H}(2) + \text{H}(2)\text{S}/\text{CaS} + \text{CaF}(2) + (\text{Pt})//\text{CaF}(2)//(\text{Pt}) + \text{CaF}(2) + \text{CaS}/\text{H}(2) + \text{H}(2)+\text{Ar}$ ) show that the emf of the cell is directly related to the difference in sulfur potentials established at the  $\text{Ar} + \text{H}(2) + \text{H}(2)\text{S}$ /electrode interfaces. The electrodes convert the sulfur potential gradient across the calcium fluoride electrolyte into an equivalent fluorine potential gradient. Response time of the probe varies from approximately 9 hr at 990 K to 2.5 hr at 1225 K. The conversion of calcium sulfide and/or calcium fluoride into calcium oxide is not a problem anticipated in commercial coal gasification systems. Suggestions are presented for improving the cell for such commercial applications. Author

(CONF-760617-3) Avail NTIS HC A03/MF A01

Results of testing the laboratory-scale cells of prismatic configuration having electrodes fabricated by hot-pressing, electrochemical formation, or vibratory loading are presented. Prismatic cells were operated with specific energies of 115 V-h/kg at the 10-h discharge rate and specific powers of 140 W/kg at full charge and 100 W/kg at 50 percent discharge. Higher performance can be expected from improved cell designs which increase the ratio of electrode and active material weight to total cell weight, replacement of the ceramic fabric separators presently used by ceramic paper separators, and development of cells with lower electrical resistance. The choice of electrode fabrication techniques and cell designs for the second round of industrial contracts are described. The design and performance testing of the cells to date suggest that the technical program goals for both applications can be met. ERA

Avail NTIS

HC A11/MF A01

The ZnSe H<sub>2</sub> Process is a multi-step thermochemical cycle which involves novel selenium-based chemistry and offers, in principle, the possibility of higher energy efficiency than competitive processes based on water electrolysis. A high temperature heat source such as provided by a gas-cooled nuclear reactor is required. The process in the 60 000 lb/hr reference plant design is 26 percent efficient. The H<sub>2</sub> cost is about \$28/MM Btu. This amount is considerably above the \$5-8/MM Btu estimate for other reported processes for hydrolysis of water. The bulk of the product cost is in capital cost fixed charges. The conceptual capital cost estimate is \$3 100 million, consisting of \$900 million for the UHTR (Ultra High Temperature Reactor) heat source, and \$2,200 million for the ZnSe H<sub>2</sub> process. Selenium and molybdenum availability may be limitations on full scale implementation of the process. ERA

**ECONOMIC ANALYSIS OF SOLAR WATER AND SPACE HEATING**

Nov 1976 312 p refs

(Contract EX-76-C-01-2322)

(DSE/2322-1-Suppl) Avail NTIS HC A14/MF A01

Based on comparison with conventional energy costs, solar water heating and solar space heating installed at an equivalent system cost of \$20 per square foot of collector is competitive today against electric resistance systems throughout most of the U.S. If the system cost is reduced to \$15 per square foot, solar systems become competitive against oil hot water heating and/or oil and electric heat pump space heating in many cities. Finally if the cost should be reduced to \$10 sq ft by 1980 through a combination of technical innovations and incentives, solar hot water and heat would be economically competitive against all residential fuel types. Solar system designs for 13 cities were optimized so as to minimize the life cycle cost over the assumed 20 year life time of the solar energy systems. The major assumptions regarding the solar system, type and use of buildings, financial considerations, and economic environment used in the design optimization are given. ERA

(BNL-22164) Avail NTIS HC A02/MF A01

The hydrogen-chlorine (H<sub>2</sub>-Cl<sub>2</sub>) cell has been suggested as an electric energy storage battery. Recently, this system was proposed for energy storage applications in electric utilities with the following advantages over the batteries and the hydrogen-oxygen (H<sub>2</sub>-O<sub>2</sub>) system which is being considered for the same purpose: (1) since the electrode reactions of H<sub>2</sub> and Cl<sub>2</sub> are quite reversible, one can expect an overall efficiency (electric yields electric) of over 75 percent; (2) the same electrodes can be used as electrocatalysts in both modes (chemical and electricity generation). Therefore, the same electrochemical cell can be used for both functions, which reduces the capital costs; and (3) the reactants for chemical and electricity generation are stored outside the cell which appears beneficial for a weekly cycle. A preliminary technical and economic feasibility assessment of the hydrogen-halogen battery as an electric energy storage system was undertaken and results are presented

The environmental impact of increased coal usage was examined, as well as the problems encountered by coal companies in recent years. Research was presented on alternate energy sources, especially that regarding the bituminous sandstones prevalent in California. A coal desulfurization project being conducted using powdered iron, coal and fuel oil was examined and the space shuttle project and a methane-driven automobile project were briefly mentioned. The direct use of coal was predicted as reaching 24 quads by the year 2000, with coal gasification and liquefaction moving to perhaps 14 quads. Shale oil production could reach 7 quads. The results of a study on manufacturing gas or generating electricity were presented in which coal is used specifically for both processes. The efficiency from an energy

standpoint, cost to the consumer and capital requirements were emphasized ERA

Aug 1976 75 p

(Contract EX-76-C-01-2021)

(FE-2021-4) Avail NTIS HC A04/MF A01

The primary type of benefit quantified is the national savings to be realized as a result of having cheaper supplementary oil available from enhanced recovery than would be otherwise available under uncertain alternative futures Alternative types of

benefits are also reviewed including those associated with avoiding more expensive re-entry of stripper wells at a later time, with the balance of payments value of enhanced recovered oil and with enhanced recovered oil becoming part of a national emergency stockpile Other benefits unquantified are those associated with insurance and portfolio values Sensitivity of the benefit/cost ratios to alternative assumptions is illustrated through a number of sensitivity analyses These analyses indicate that the expected benefits from the development of enhanced oil recovery technology substantially exceed Federal program costs ERA

Jan 1977 56 p  
(Contract EX-76-C-10-3784)  
(TID-27435) Avail NTIS HC A04/MF A01

The need for and direction of nuclear power development the various nuclear options being considered in detail, including breeder reactor and associated fuel-cycle technologies were studied. But decisions regarding nuclear energy cannot be made in a contextual vacuum the time scale and the context in which these decisions should be made depend not only on the technical social and economic status and impacts of other energy-supply technologies, but also on assumptions concerning future levels of demand for energy and the possibilities for energy conservation through changes in consumption patterns and improved efficiency of the supply and end-use systems. The study, therefore seeks to relate the many important factors that impinge on ERDA's and the nation's energy decisions and thereby on the ultimate role of nuclear power. ERA

Joseph C Nirschl Apr 1977 28 p refs  
(AD-A039995, ECOM-4495) Avail NTIS HC A03/MF A01  
CSCL 18/4

A solar power radiacmeter (breadboard) design is described, based on a miniature (18 cc) ionization chamber and low power, solid-state (Field Effect Transistor, FET) electrometer. Power demand for this instrument, including DC converter, is approximately 5 mW. Preliminary experiments with a 20 sq cm silicon solar cell panel and pen light (AA size) rechargeable (NiCd) battery suggest feasibility of this approach. Solar power intake and dissipation is discussed for experiments conducted.

CSCL 10B

The potential for pumped storage hydroelectric development of the Hells Canyon area is reviewed with conclusions drawn from preliminary investigation. Background information covers the concept and application of pumped storage. Hells Canyon's physical characteristics and history and its status as a National Recreation Area. Of eighteen potential storage sites noted, the three most promising are analyzed in detail. For each, preliminary designs were developed as well as computer analyses of the reservoir water level fluctuations that would result from such operations. Each is also analyzed for economic feasibility. Conclusions are that pumped storage in the area is too expensive to be competitive now, but it may be more feasible in the future. GRA

PARTICULATES**

M Mentser and A G Sharkey, Jr Mar 1977 53 p refs  
(PERC/RI-77/5) Avail NTIS HC A04/MF A01

High resolution mass spectrometry was used to analyze the  
organic material associated with diesel exhaust particulates in  
order to detect hazardous compounds. Diesel fuels and respirable  
coal mine dusts were also surveyed. Mass spectra were obtained  
on approximately 50 samples of particulates from diesel engine  
tests. The tests involved precombustion chamber and direct  
injection engines operating in different modes of speed and load  
using three grades of diesel fuel. Distribution of hydrocarbons  
changed in a characteristic manner as the speed and loading of  
the engines increased from idle to rated speed and full load.  
The composition profiles were little affected by engine or fuel  
type. The composition of diesel particulates was investigated as  
a function of particle size from less than 0.2 to greater than or  
approximately equal to 3.0 micrometers.

IN PUERTO RICO**

William R Jobin, Frederick F Ferguson, and Raymond Brown  
Oct 1976 84 p refs Sponsored by ERDA  
(CEER-1) Avail NTIS HC A05/MF A01

Published literature and available data on the ecology of  
hydroelectric reservoirs and other lakes in Puerto Rico was  
reviewed. Various studies on unrelated elements in the aquatic  
ecology were examined. The majority of the island wide studies  
pertained to surveys on snails related to the parasitic disease  
bilharzia. A survey of 28 major lakes in 1976 showed that  
Biomphalaria glabrata was gradually displaced from most of the  
lakes by Marisa cornuarietis and Tarebia granifera, two foreign  
snails which do not transmit bilharzia. Of the 17 lakes contain-

ing B. Glabrata in 1956, only 8 remained infested in 1966 and  
only 5 in 1976, twenty years after the introduction of Marisa  
cornuarietis. Although the trend indicates that the lakes may be  
safe from transmission, a monitoring system is necessary before  
the lakes are used for recreation.

**PACIFIC NORTHWEST REGIONAL ASSESSMENT PRO-  
GRAM Annual Report, 1976**

Jun 1976 40 p refs

(Contract E(45-1)-1830)

(BNWL-2084) Avail NTIS

An integrated analytical assessment program was established  
for evaluation of potential changes that may result from various  
energy development or conservation scenarios. Such scenarios  
may themselves result from Federal development policies and  
programs, from regionally specific actions by the states and energy  
industries, or from actions taken by international factors currently  
importing energy resources into the region. After consideration  
of a variety of approaches to integrated assessment at a regional  
level, dynamic simulation techniques were developed to provide  
the best available approach to evaluating the issues pertinent to  
the Northwest.

(PB-267923/1, BM-IC-8736) Avail NTIS HC A02/MF A01 CSCL 08I

A computerized mapping system was developed by the Bureau of Mines to provide procedures for the rapid and inexpensive display of coal reserve data. Mapping system output consists of two types of maps: point distribution and contour (isopleth), which can be produced for data (coal analyses) associated with a point location (outcrop, drill core, or mine samples). The primary advantage of this system is that it enables the display of a rapidly changing data base and computerized map generation without the intermediate steps of digitizing and overlaying to produce base maps. The mapping system is applicable to any regional mineral reserve or resource study for which point location data are available. Included are example maps of the distribution of data points and contouring for sulfur content of the Upper Freeport coalbed in the western Pennsylvania demonstration area. GRA

refs  
(Contract EY-76-C-06-1830)  
(BNWL-2195) Avail NTIS HC A04/MF A01

The ENFORM system of computer codes can be used to calculate the amount of fuel material in the nuclear fuel cycle as a function of time. The material amounts are determined by an input schedule of installed electric energy generation capacity. In addition to the amount of uranium and plutonium in the fuel cycle, the system also accounts for 175 radionuclides. The chemical effluents released to the environment are modeled by using simple release factors. All release factors and dose coefficients are specific for each type of plant in the nuclear fuel cycle. The material logistics and effluent accounting features of the ENFORM system are supplemented by a fuel cycle economics package. This module provides fuel cycle processing costs and the leveled cost of power. The ENFORM system also provides means of estimating the effect of changing nuclear growth scenarios and changing environmental control technologies on nuclear fuel cycle effluents, economics and logistics. The development and production of electric drive vehicles have been successful in the Federal Republic of Germany, Japan, the United Kingdom, USSR, and, to a lesser degree, in France, Italy and Sweden. These vehicles are basically designed for commercial or industrial application, and, in general, a typical vehicle of this type has a maximum range of 95 to 200 km and a maximum speed of 27 km/h. Military applications of electric drive vehicles for transportation and combat are significant because they offer a number of advantages over more conventional drive systems. GRA

The effectiveness of pyrolysis was determined for treatment of three selected chemical wastes: petroleum refinery wastes, styrene production wastes, and rubber manufacturing wastes. The average conversion of organic material in the waste to organic material in the gaseous pyrolyzer effluent was 70 percent for refinery waste, 60 percent for styrene waste, and 80 percent

for rubber waste. In each case the vapor stream contained a wide variety of organic compounds from methane and acetylene to high boiling aromatic liquids and tars, including appreciable concentration of polynuclear aromatic hydrocarbons. The residual ash in each case was 80 percent inorganic material. Technical and economic feasibilities were discussed. GRA

**AN OVERVIEW OF CONCEPTS FOR AIRCRAFT DRAG REDUCTIONS**

Jerry N. Hefner and Dennis M. Bushnell. In AGARD Spec Course on Concepts for Drag Reduction. Jun 1977. 30 p. refs

Avail NTIS HC A13/MF A01 CSCL 01A

A current overview of aerodynamic drag reduction concepts which have potential for reducing aircraft fuel consumption is presented. The discussion shows where the greatest percentages of aircraft fuel is burned and what areas have the greatest potential for fuel conservation. The paper deals with aerodynamic improvements and touches only briefly on structural and propulsion improvements. Concepts for reducing pressure drag (i.e., roughness, wave, interference, and separation drag) drag due to lift/induced drag, and skin-friction drag at subsonic and supersonic speeds are emphasized. **THE ATS-6 POWER SYSTEM HARDWARE IMPLEMENTATION AND ORBITAL PERFORMANCE**

Thomas A. LaVigna and Franklin L. Hornbuckle. Sep 1977. 49 p. refs. (NASA-TP-1023, G-7703X10). Avail NTIS HC A03/MF A01 CSCL 10C

The Applications Technology Satellite-6 power system, a shunt-boost configuration, uses partial shunt regulation of the solar array and a boost regulator for control of battery power. Regulation is provided for three different operating modes: shunt, charge, and boost. This configuration achieves the highest efficiency of power transfer from the solar array to the loads. The excellent dynamic regulation and low output impedance of the power system virtually eliminated the problem of subsystem interactions on the power bus due to conducted interference from load current fluctuations. The performance of the power system continues to be excellent. The solar array degradation (18.5 percent) was less than the specified 20 percent in two years in spite of extreme cycling from -160 C to 60 C. A unique battery cycling regime of discharges varying from 5 percent to 60 percent daily is being encountered. During the second year, noneclipse discharges have occurred twice a day to depths of 35 percent and 45 percent. Battery performance was good with only a small decrease in end-of-discharge voltage. A recent test to evaluate capacity gave 12.4 AH (83% of the nominal capacity of 15 AH) after over 1400 battery discharge cycles. A small increase in the end-of-charge voltage has recently occurred necessitating a change in the charge regime to achieve full charge conditions. Author

**DETERMINATION OF HYDROGEN SULFIDE IN REFINERY FUEL GASES. Final Report**

Joseph E. Knoll. Jan 1977. 40 p. refs. (PB-268240/9, EPA-600/4-77-007). Avail NTIS HC A03/MF A01 CSCL 07D

Test methods for the iodimetric measurement of hydrogen sulfide in refinery fuel gases are known to suffer from serious thiol interferences. An absorbing solution consisting of 0.16 M cadmium sulfate/sulfuric acid at pH 3.0 is shown to be effective for the collection of hydrogen sulfide in the 70-700 mg/cu m range and to be essentially free from interference by up to 1800 mg/cu m of methanethiol. When combined with a single 3 percent hydrogen peroxide impinger, sulfur dioxide interferences

of up to 1,300 mg/cu m are also removed. No measurable interference results from the presence of carbon oxysulfide, ethene, dimethyl sulfoxide, or thiophene. Acetaldehyde and acetone are observed to interfere at the 2,400 and 48,000 mg/cu m level, respectively. ERA

**METALLURGICAL ANALYSIS OF A PLAIN CARBON-STEEL PLATE AFTER LONG-TERM SERVICE IN A COAL GAS-IFIER**

J. R. Fischer, J. DeAngelis, P. P. Gillis and O. J. Hahn. Apr 1977. 58 p. refs. (PB-268106/2, IMMR27-PD16-77). Avail NTIS HC A04/MF A01 CSCL 11F

A steel inner liner which was directly exposed to a coal gasification reaction for 20 years was examined. The microstructure was observed, the mechanical properties measured, and the chemical composition analyzed as functions of position in the vessel. Evidence of corrosion embrittlement and carburization was sought. Microstructural variations were rationalized, and a correlation of microstructure and mechanical properties was attempted. The initial properties of the steel were estimated and compared to the final measured properties. Certain conclusions were reached concerning the operating conditions of the vessel, and the suitability of the material for its design environment. GRA

Ph.D. Thesis. Mustafa Sengul. 1977. 221 p.

Avail Univ. Microfilms. Order No. 77-12697

Solutions were generated for the range of values of the three parameters typically found in Alaska's North Slope. It is found that the relationship between the dimensionless radius of the thawed permafrost region and dimensionless time can be expressed by a simple power law equation containing two constants. The relationships among these two constants and the three dimensionless parameters are given in two correlating curves. These correlations can be used to forecast the radius of the thawed permafrost region and its temperature distribution at any given time. Dissert. Abstr.

Avail NTIS HC A03/MF A01 CSCL 13B

Environmental changes and the utilization of finite resources are analyzed. Beyond the satisfaction of basic physical needs, the advancement of civilization toward an ever-improving quality of life is likewise dependent upon man's interaction with his entire environment. This larger system is controlled externally by electromagnetic and particle energy from the sun and internally by the dynamic interchange of energy between the solid earth, oceans, the atmosphere, and the magnetosphere. This exchange of energy that determines the structure of the earth's environmental system is evaluated. Author

HC A04/MF A01 CSCL 08I

Forty-nine days of earthquake monitoring around the Roosevelt Hot Springs KGRA during 1974 and 1975 indicates little earthquake activity and no correlation with the Hot Springs area. Marked earthquake activity, however, was located 25 km east within the Cove Fort-Sulphurdale KGRA. A total of 163 earthquakes were located from the two surveys. Focal depths for the Cove Fort area were shallow with 75% of the activity less than 5 km in depth. The maximum calculated depth was 16 km. Composite fault plane solutions in the Cove Fort area showed normal faulting with generally east-west trending T-axes. A high b-value of 1.27 and a statistical analysis using the Kolmogorov model of event occurrence imply swarm-like activity near Cove Fort. Consistently positive P-wave residuals of up to 0.10 sec and detectable S-wave attenuation of ray paths across the Mineral Range are suggestive of the possibility of an upper-crustal zone of high attenuation that is perhaps related to the source of heat of the Roosevelt Hot Springs KGRA. Hydrogen is produced by the solar photolysis of water in a first photooxidation vessel with a transparent wall in the presence of a water soluble photooxidizable reagent and an insoluble hydrogen recombination catalyst. Simultaneously oxygen is produced in a second photoreduction reactor with a transparent wall in the presence of an insoluble photoreduction reagent catalyst. When spent, the solution from the first reactor is fed into the second reactor. A reaction occurs in the dark in which the redox reagents are regenerated, and the regenerated photooxidation reagent solution is recycled to the first reactor. The photoreduction-catalyst is a bifunctional reagent catalyst including a transition metal salt together with a hydroxyl or chlorohydroxyl decomposition catalyst of high area.

A method for converting heat energy from low temperature heat sources to higher temperature was developed. It consists of a decomposition chamber in which ammonia is decomposed into hydrogen and nitrogen by absorbing heat of decomposition from a low temperature energy source. A recombination reaction then takes place which increases the temperature of a fluid significantly. The system is of use for the efficient operation of compact or low capital investment turbine driven electrical generators, or in other applications, to enable chemical reactions that have a critical lower temperature to be used. The system also recovers heat energy from low temperature heat sources, such as solar collectors or geothermal sources, and converts it to high temperatures. Official Gazette of the US Patent Office

Ombo Ferguson Isokrani 1976 312 p

Avail Univ Microfilms Order No 77-11531

Multiphase fluid flow equations and constitutive relationships describing deformable, anisotropic, heterogeneous, and nonisothermal reservoirs such as the Gulf Coast geopressured geothermal aquifers were derived. This mathematical model has been numerically solved using a computer program. Reservoir drive mechanisms considered include fluid and rock matrix compressibilities, formation compaction, shale water influx, fluid expansion and natural gas in solution. Gravity, capillarity, and pressure and temperature dependence of fluid densities, viscosities, natural gas solubility in water, and gas deviation factors have been considered. The computer program was used to analyze the reservoir drive mechanisms of fluid and rock matrix compressibilities, formation compaction, shale water influx, natural gas dissolved in geopressured waters, and fluid expansion. Long-term forecasts of performance using various extraction strategies were made. Permeability, multiple wells, and thermal sensitivity analyses were made. Dissert Abstr

This study assesses the potential market for combined solar space heating and domestic hot water heating in Department of Defense (DoD) buildings The study considers eight building categories family housing, bachelor enlisted quarters bachelor officers quarters, administration, training, operational, community support, and recreational, which together contain 683 million sq

ft (61.5 million sq m) or 40 percent of the DoD inventory. All buildings were assumed to be oil heated. The buildings were grouped by climatological/solar regions, and the loads for each building type were determined by using the Energy Utilization Index (EUI) method. Solar system performance in each region was obtained by using the U.S. Army Construction Engineering Research Laboratory universal curve method. The life-cycle costs of providing solar space heating and domestic hot water heating were analyzed, and the DoD market potential for installed solar system costs of \$9, \$15, and \$20 per square foot was determined. The study shows that at an estimated initial fuel cost of \$3.50 MBtu for oil heating, a 10 percent cost of money, and an 8.5 percent overall fuel inflation factor, solar systems for space heating and domestic hot water heating become economically feasible when installed system costs are \$14/sq ft (150/sq m). When installed system costs reach \$9/sq ft (\$97/sq m), the market potential becomes 172 million sq ft (15.5 million sq m) of solar collectors. The study also shows the largest potential market at these economic conditions to be family housing which contains a total of 102 million sq ft (9.2 million sq m).

The performance of heat pipe/thermal energy storage unit (HP/TESU) powering a Vuilleumier (VM) cryocooler during simulated orbital eclipse periods was demonstrated. Operation with the HP/TESU was shown to have no significant cold stage performance penalty on the VM. The power consumption rate of the VM was determined to be approximately one-half the nominal design value (750 wt) due probably to high first stage heat leaks. VM cold stage performance was stable over large hot cylinder temperature variations (50-100 C). No thermo-mechanical or integration problems were incurred. Operation of HP/TESU as a combined thermal storage medium and hot cylinder heating mechanism is feasible.

The elements of a rational national energy policy are reviewed. An exploration of alternative financing methods for energy planning follows. Recommended basic financing follows from a Federal Energy Tax coupled with tax credit provisions for State efforts. A tax of no more than 0.1 mill per kilowatt hour enacted at the national level could produce ample funds for an equivalent tax on other fuels based on BTU equivalents, tax credit provision that would transfer up to two-thirds mill per kilowatt hour from the Federal government to States, a bonus incentive for regional planning, and a conservation tax that would encourage a more significant response to conservation.

(Contract EY-76-C-07-1570)

(TREE-1048) Avail NTIS HC A04/MF A01

An experiment using geothermal water for irrigation is described and preliminary results are discussed. The water from a moderate temperature well, having salinity of about 2000 ppm, is considered characteristic of the types of geothermal fluids that will be obtained from the young volcanic/young sediment formations of the northern intermountain west. About 12.5 acres

in southern Idaho were subdivided by crops and irrigation practices for investigation with the geothermal water and a control comparison water from the Raft River. The experiment addresses heavy metal uptake in plants, plant fluoride retention and damage, plant tolerances to salts, soil alterations and other behavior as a result of the geothermal fluids. First results indicate no apparent difference between the geothermal watered crops and those obtained using the fresh water control. ERA

(Grant NSF GI-36598)

(PB-268524/6, EIR-77/1, NSF/RA-770068) Avail NTIS HC A09/MF A01 CSCL 07A

Quantitative methodology for characterizing the energy utilization efficiency of waste oil reclamation processes is provided. A simple, reasonably accurate approach was taken to predict the thermodynamic availability, enthalpy, and entropy of petroleum fractions, water, and stack gas. Thermodynamic analysis was based on an availability balance including a lost work term associated with each unit of equipment. Efficiency based on the ideal work of the process and the total process lost work was defined as a means to measure the energy utilization efficiency of the process. GRA

The effect of operating electrical equipment of pumped-storage plants over a variable frequency range of 30 to 81 Hz was studied. The motivating factor behind the study was the desire to improve pumped-storage hydro efficiency. The electrical equipment considered included the generator/motor, excitation equipment, switchgear and bus, metering, surge protection, relaying, and power transformer. Converter harmonics and the converters' effect on system power factor were analyzed for the operator/motor. A simulation study was conducted on a hybrid computer to identify potential system problems which arise from variable speed operation. GRA

T A Coultas, J M Cook, P Crnkovich, and P Dauzvardis  
Feb 1976 28 p refs Presented at the 6th IEEE Symp on Eng problems of Fusion Res., San Diego, Calif., 18-21 Nov 1975 (Contract W-31-109-eng-38)

(ANL/CTR-TM-40, Conf-751125-149) Avail NTIS  
HC A03/MF A01

A simulation of a theta-pinch fusion power plant has been completed to the point where economic feasibility can be examined. A cost subprogram is presented for interfacing with a computer code. This code is then used to obtain a first approximation of the costs for the reactor. Independent geometrical and plant design parameters are varied over a wide range with simultaneous variation of magnetic field, minor first wall radius, and plasma maximum compression. The study indicates that the plant energy balance must be favorable, availability must be high, and major component costs must be low to achieve economical results. Although costing uncertainties remain, it is clear that development of easy and rapid replacement methods for reactor components is essential and that new staging concepts to reduce the implosion energy requirements must be pursued. **POWER LOSS PROBLEMS IN EXTRAP COIL SYSTEMS Research and Training Programme on Controlled Thermonuclear Fusion and Plasma Physics (EUR-NE)**

B Lehnert Feb 1977 17 p refs Sponsored by EURATOM (TRITA-PFU-77-02) Avail NTIS HC A02/MF A01

The ohmic power loss in the coils of external ring traps is minimized with respect to the thermonuclear power production. In the case of the DT-reaction this leads to dimensions and power densities being relevant to full-scale reactors. Not only superconducting or refrigerated coil windings can thus be used, but also hot-coil systems which are operated at several hundred C and form part of a steam cycle and power extraction system. For hot coils the problems of void formation and tritium regeneration have to be further examined. The high beta value leads to moderately large coil stresses. Finally, replacement and repair become simplified by the present coil geometry. Author (ESA)

**PROJECTED THERMODYNAMIC EFFICIENCIES OF FUSION POWER PLANTS**

M. A. McKinnon. Sep 1976. 15 p. refs.  
 (Contract EY-76-C-06-1830)

(BNWL-2017). Avail. NTIS HC A02/MF A01

Estimated thermal efficiencies of proposed fusion power plant concepts are compared to the efficiencies of nonfusion power plants. Present trends in electrical power generation are also discussed. The fusion reactor system designs have the same thermal efficiencies as power plants using steam if these designs require the collection of thermal energy at the blanket and the transfer of that energy to a heat exchanger or boiler using the current technology. Methods should be developed for increasing the temperatures of the reactor coolants since the maximum attainable thermal efficiency of systems using coolants can be increased only by increasing the coolant temperatures. Advanced power recovery systems such as potassium topping turbines, MHD, and direct conversion should be developed since such systems avoid the limits on steam systems due to excessive operating pressures at high temperatures. ERA

**N77-32955** Stanford Univ., Calif.  
**HEAT TREATMENT OF REFUSE FOR INCREASING ANAEROBIC BIODEGRADABILITY** Ph.D. Thesis

James Michael Gossett. 1977. 222 p.

Avail. Univ. Microfilms. Order No. 77-12640

Heat-treatment methods for altering the normal association of lignin with cellulose in municipal refuse were investigated with the aim of improving anaerobic digestibility. Increases in biodegradability were determined by a rapid bioassay procedure using a Warburg respirometer to measure increases in gas production by an anaerobic methane-producing mixed culture. The maximum increase in biodegradability was found near pH 13, where the biodegradability of the previously-digested material was doubled after treatment for one hour at 200°C. A simple model is presented which somewhat successfully predicts resulting biodegradabilities using the biodegradability of the untreated material and the measured or estimated chemical compositions of treated and untreated samples as inputs. A key assumption of the model is that the biodegradability of remaining solid-phase carbohydrate is a linear function of the extent of delignification.

**TECHNOLOGY REQUIREMENTS FOR ADVANCED EARTH-ORBITAL TRANSPORTATION SYSTEMS: SUMMARY REPORT** Final Report

Rudolph C. Haefeli, Ernest G. Littler, John B. Hurley, and Martin G. Winter. Washington: NASA, Oct 1977. 62 p.  
 (Contract NAS1-13916)

(NASA-CR-2867). Avail. NTIS HC A04/MF A01 CSCL 22B

Areas of advanced technology that are either critical or offer significant benefits to the development of future Earth-orbit transportation systems were identified. Technology assessment was based on the application of these technologies to fully reusable, single-state-to-orbit (SSTO) vehicle concepts with horizontal landing capability. Study guidelines included mission requirements similar to space shuttle, an operational capability beginning in 1995, and main propulsion to be advanced hydrogen-fueled rocket engines. The technical and economic feasibility of this class of SSTO concepts were evaluated as well as the comparative features of three operational take-off modes, which were vertical boost, horizontal sled launch, and horizontal take-off with subsequent in-flight fueling. Projections of both normal and accelerated technology growth were made. Figures of merit were derived to provide relative rankings of technology areas. The influence of selected accelerated areas on vehicle design and program costs was analyzed by developing near-optimum point designs. Author

The potentially useful encapsulating materials for Task 3 of the Low-Cost Silicon Solar Array project were studied to identify, evaluate, and recommend encapsulant materials and processes for the production of cost-effective, long-life solar cell modules. Materials for study were chosen on the basis of existing knowledge of generic chemical types having high resistance to environmental weathering. The materials varied from rubbers to thermoplastics and presented a broad range of mechanical properties and processing requirements. Basic physical and optical properties were measured on the polymers and were redetermined after exposure to indoor artificial accelerated aging conditions covering four time periods. Strengths and weaknesses of the various materials were revealed and data was accumulated for the development of predictive methodologies. To date, silicone rubbers, fluorocarbons, and acrylic polymers appear to have the most promising combination of characteristics. The fluorocarbons may be used only as films, however, because of their high cost.

**ESTIMATION OF NET ENTHALPIES OF COMBUSTION OF SOME AVIATION FUELS EXPRESSED IN THE INTERNATIONAL SYSTEM OF UNITS (SI)** Final Report

Ralph L. Nuttall and George T. Armstrong. Apr 1977. 64 p. refs.  
 (NBS-TN-937). Avail. SOD HC \$1.30 as Ep46 937

Correlating equations, using SI units, which are linear in each of the variables, (1) aniline point in deg. C, (2) reciprocal density in grams per cubic centimeter, and (3) sulfur mass percent, are presented for five classes of aviation fuels. These equations fit the observed values at least as well as the previous aniline point-gravity product equations. An equation which is quadratic in aniline point and reciprocal density was found to fit all the data with a standard deviation of 25.4 Btu/lb = 0.05904 MJ/kg. This equation can be used to predict the net heat of combustion of the fuels considered to within 50 Btu/lb or 0.11808 MJ/kg at a 95 percent confidence level. Author

In recent years, particularly since the Oil Embargo of 1973, all major fuel consuming sectors in the United States Navy have become increasingly aware of the limited supply and high cost of petroleum fuels. Fuel is currently consumed by the Navy at the rate of 230,000 barrels per day. Energy conservation is one method to reduce this demand on petroleum resources and the resulting high annual expenditures for fuel. In addition, conservation is in the long-term interests of the country, since it assists nationwide efforts to stretch our remaining oil reserves. Alternatives to petroleum-based fuels are another option. One of these, shale oil, is being evaluated by the Navy in their 100,000 barrel oil shale experiment. Yet another option could be the use of fuels which do not meet all the requirements of military specifications (MILSPECs) for fuels, but which could be burned without significantly impairing naval operations. This approach could increase fuel availability and reduce costs to the Navy. To assess the feasibility of using non-MILSPEC fuels in Navy combustion equipment, the David W Taylor Naval Ship Research and Development Center engaged the Aerotherm Division of Acurex Corporation to perform a study with the following objectives: (1) determine whether there exists a large supply of fuel beyond that currently being procured for the Navy which meets or nearly meets, military specifications, (2) determine whether any such comparable 'nonspec' fuel is less expensive than the currently approved product, and (3) assess, using all available information, the viability of storing, handling, and burning comparable 'nonspec' fuels in naval systems, even if only on a limited basis. **HYDROGEN PRODUCTION FROM COAL LIQUEFACTION RESIDUES Final Report**

Allen M Robin Dec 1976 71 p  
(EPRI Proj 714-1)

(EPRI-AF-233) Avail NTIS HC A05/MF A01

High ash H-coal residues from the liquefaction of coals were gasified in a synthesis gas generator. The synthesis gas produced consisted of over 92 percent volume carbon monoxide and hydrogen on a dry basis. Approximately 40 tons of each residue was gasified at 24 atmospheres pressure at residue feed rates up to 1/2 ton per hour. No major operating problems were experienced. Cold gas efficiencies averaged between 83 and 84 percent. Steam and oxygen requirements were comparable to those of heavy oil gasification. Enough data were obtained to verify existing computer correlations and establish information needed to provide a commercial plant design for these two, and other similar, coal liquefaction residues. The general technology for desulfurizing motor gasoline is described and prior studies reviewed. The removal of additional sulfur from motor gasoline may be required because catalytic converters on 1975 and later model cars may convert the sulfur into potentially environmentally undesirable compounds, sulfuric acid mist and sulfate particles, when the exhaust passes through the catalytic converter. While other methods of solving this environmental issue are available, only the removal of additional sulfur from gasoline is considered. ERA

A mathematical model for waterflood performance is described and a numerical solution method is applied. This method is based on spatial discretization by the finite element formulation of the Galerkin method and a semi-implicit formulation in time. A computer program is briefly described and several example problems are solved. The various alternatives included in the formulation of the solution method are compared and guidance is given as to how the model is most efficiently applied. Author (ESA)

The need to evaluate mechanical performance of mine tools and to obtain test performance data from candidate systems dictate that an engineering data recording system be built. Because of the wide range of test parameters which would be evaluated, a general purpose data gathering system was designed and assembled to permit maximum versatility. A primary objective

of this program was to provide a specific operating evaluation of a longwall mining machine vibration response under normal operating conditions. A number of mines were visited and a candidate for test evaluation was selected, based upon management cooperation, machine suitability, and mine conditions. Actual mine testing took place in a West Virginia mine. Author

**AN ECONOMIC MODEL OF NEW CRUDE OIL AND NATURAL GAS SUPPLIES IN THE LOWER 48 STATES**  
Ph D Thesis

Young Yuel Kim 1977 207 p  
Avail Univ Microfilms Order No 77-19565

An economic model is developed to show how reserve additions and economics of oil and gas will be affected by wellhead prices, tax provisions, finding rates, and drilling capacity availabilities. The range of reserve additions estimated by the model where government pricing and taxing policies are varied is much greater than the range of reserve additions estimated by the U S Geological Survey where government pricing and taxing policies are not varied. Results of the model show how supplies of crude oil and natural gas from new resources in the lower 48 states and Texas will be affected by different price relationships, tax provisions, finding rates, and time horizons. High priority in future research should be given to extending the economic analysis for the lower 48 states to include the Alaskan and Offshore areas. Dissert Abstr

Attention is given to the Imperial Valley, best known as an agricultural oasis. It is a large hot water geothermal resource as well. The difficulties of developing such a resource within a totally artificial yet highly profitable environment are discussed. Most obstacles to geothermal development are related to protection of the agricultural economy. The main concerns are for subsidence, induced seismicity, water supply blowouts, the effect of air pollution on crops, and the possible socioeconomic

changes in an established way of life. The Imperial Valley offers an abundant labor pool, huge nearby markets, transportation networks, a snow free climate, and energy which together constitute most of the important considerations in industrial location. Dissert Abstr

A design study and analyses of a 10 kW-hr, 15 kW mechanical capacitor system were studied. It was determined that magnetically supported wheels constructed of advanced composites have the potential for high energy density and high power density. Structural concepts are analyzed that yield the highest energy density of any structural design yet reported. Particular attention was paid to the problem of friction caused by magnetic and I to the second power R losses in the suspension and motor-generator subsystems, and low design friction levels have been achieved. The potentially long shelf life of this system and the absence of wearing parts, provide superior performance over conventional flywheels supported with mechanical bearings. Costs and economies of energy storage wheels were reviewed briefly. Author

This report covers the work performed under the Thermal  
Energy Storage Demonstration Unit Program The report presents  
the analysis, design, fabrication, and testing of a thermal energy  
storage demonstration unit which was to be mated to an existing  
Vuilleumier cooler (AFJLR) to demonstrate the concept of powering  
such a device directly with stored thermal energy The Thermal  
Energy Storage Demonstration Unit was to be sized for delivering  
1000 watts thermal power for one hour at a temperature of  
1250 + or - 25 F The ternary eutectic 64 MgF2 - 30 LiF-6  
KF, which has a eutectic temperature of 1310F, was selected  
as the thermal energy storage material The report presents the  
approach and the assumptions underlying the design of the unit  
which incorporates a heat pipe for the transfer of energy from  
the thermal energy storage material to the hot cylinder of the  
Vuilleumier cooler Details of the fabrication and the testing of  
the Thermal Energy Storage Demonstration Unit are presented  
The analysis of the test data led to the conclusion that the  
basic design satisfied all requirements that were established for  
a TES unit The thermal energy storage material, however, was  
found to apparently release its latent heat of fusion over a wider  
temperature range than had been anticipated This fact can be  
attributed to nonisothermal phase transformation or a bulk  
thermal conductivity that is lower than had been assumed for  
the salt Author (GRA)

 CSCL 21/4

The general problem of providing fuel gas for Navy base facilities is studied. The intent is first to provide designs of a coal gasification plant producing 6x 10 to the 9th power Btu/day reactor output, based on two types of reactors, second, to conduct parametric studies leading to means for the costing of similar plants operating on different feedstocks, and third, to provide a method for estimating the change in boiler rating which must follow the substitution of fuel gas for either oil or coal firing. The performance and economics given are based on conceptual design methods. The economic results allow comparison of fuel-gas and fuel-oil costs on the basis of the Navy's method of analyzing costs using the 'Economic Analysis Handbook,' NAVFAC P-442, 1975. The costs are the sum of all future outlays discounted to the present but allowing escalation at different rates for utilities and feedstock over a 25-year production period. Author (GRA)

 CSCL 21/4

The questions addressed and the conclusions reached in this study are (1) What range of multifuel capability may be desirable in military engines to relieve possible fuel supply problems. The conclusion is that it would be advantageous for military aircraft to be able to use all types of jet fuels and for ground vehicles and ships to be able to use all types of diesel fuels as safeguards against short-term shortages of military specification fuels (2) What liquid hydrocarbon fuel options may be considered without incurring major performance degradation or severe maintenance problems. The conclusion is that with appropriate modifications to fuel supply and starting systems, the range of

fuels defined in (1) could be used. However, R and D is needed to determine exactly what modifications are required and how fuels may be field-tested. More R and D is also needed to assemble handbooks of information on operating envelope and maintenance changes that may result from use of off-specification fuels. Current information is far from complete. Fuels from syncrudes should be included in this R and D work (3) In the long-term, what alternatives to liquid hydrocarbon fuels can be considered. In the long-term (beyond 2000) the only possibilities appear to be (a) more extensive use of nuclear power in Navy ships and (b) use of liquid hydrogen in long-range aircraft. For all land and air tactical combat vehicles however, any change from liquid hydrocarbon fuels would involve major performance changes which are probably unacceptable. Author (GRA)

The chloroplast aging and rate limitations in the photosynthetic electron transport system were studied. It was confirmed that the photosystem II acceptor, phenylenediamine, accepts electrons from two sites in the electron transport chain, one of which is uncoupler insensitive. These two sites have approximately equal rate constants and contribute about equally when photochemistry operates with maximum rates. Therefore, it was concluded that when uncoupler is present, the primary rate limitation precedes the uncoupler-insensitive transport to phenylenediamine. Fluorescence measurements have confirmed the results showing that chloroplast storage at high pH inhibits only the oxygen evolution system and not the functioning of the trap. GRA

Research in high temperature gas cooled central receivers for solar energy and for receiver conceptual design of energy storage systems compatible with higher temperature gas turbine systems was examined. The technical feasibility of high temperature thermal energy storage was studied in detail. The two advanced systems are a phase change energy storage with inorganic salts and a reversible thermochemical reaction energy storage system. A third system, a sensible heat pebble bed energy storage system was investigated as a near term benchmark. The phase change concept offers the most economic incentive primarily as a result of its high storage density. Major technical barriers involve storage media and container material compatibility testing. The thermo-chemical concept is the most attractive from a plant control flexibility standpoint. The major technical uncertainty is the required catalytic SO<sub>3</sub> dissociation reactor

The potential biological productivity of an open-sea mariculture system utilizing the deep-sea water discharged from an ocean-thermal energy conversion (OTEC) plant was investigated. In a series of land-based studies, surface water was used to inoculate deep water and the primary production of the resultant blooms was investigated. Each cubic meter of deep water can produce approximately 234 g of phytoplankton protein, and an OTEC plant discharge deep water at a rate of 45 x 10 to the fourth power cu m min to the -1 power could produce 53 x 10 to the seventh power kg of phytoplankton protein per 350-day year. A series of land-based shellfish studies indicated that, when fed at a constant rate of 183 x 10 to the 3 power g of protein per second per 70-140 g of whole wet weight, the clam, *Tapes japonica*, could

convert the phytoplankton protein-nitrogen into shellfish meat protein-nitrogen with an efficiency of about 33 per cent. Various factors affecting the feasibility of open-sea mariculture are discussed

(Contract EY-76-C-02-2864)

(COO-2864-1, F-C4362) Avail NTIS HC A05/MF A01

Results of a study on the technical and economic feasibility of augmenting heating of boiler feedwater in steam electric power plants by solar energy are presented. The possibility of retrofitting existing oil or gas fired steam plants with solar collection systems was investigated. The use of four solar collectors in connection with different methods of single degree of freedom sun following motions was examined. For all collectors, daily sun following without seasonal adjustment of tilt was found to be cost-effective. Conclusions indicate solar augmentation of boiler feedwater heating does not constitute a cost-effective method of fossil fuel conservation

An overview is provided of energy programs being conducted in the development of economical and environmentally acceptable alternative energy sources. About 75 percent of the resources of this laboratory are applied to research and development for national security programs having to do primarily with nuclear weapons. The remaining 25 percent are applied to energy programs and energy-related activities, particularly those requiring resources that are also used in nuclear weapon and other national security programs. Examples of such energy programs and activities are research into nuclear fusion, protection of nuclear materials from theft or diversion, and the disposal of radioactive waste. Instruments developed to detect, measure, and record the detonation of nuclear devices underground are now being used to support the development of in-situ processing of coal and oil shale

A number of actions have been taken in the United States to prevent and to delay installation and development of nuclear technology. These actions are reviewed and analyzed with emphasis on the 1976 California nuclear moratorium referendum and other more recent actions at state and national levels. They are compared with the status and outcome of similar actions in other nations as is possible. Additionally, ERDA's current

approaches to public involvement in the decision making process is discussed, including the value of comprehensive analyses of health, environmental, and socioeconomic aspects of alternative energy sources in responding to public needs. U.S. plans for providing such analyses for all installed and developing energy technologies are presented with special reference to areas which require international cooperation for implementation. The value of international analysis and internationally accepted environmental control strategies for all energy technologies is also addressed. ERA

1976 81 p Workshop held at San Francisco, 21 Sep 1976

Sponsored by ERDA

(TID-27444) Avail NTIS HC A05/MF A01

By the year 2000, a water deficiency of about 2,250,000 acre-feet will exist in California; therefore, many agencies will not indefinitely commit supplies of fresh water for power plant cooling. Legislation for siting power plants along the coastline is summarized. A report is given on a program to investigate the energy required to develop water, or in short, to move water to where it is to be used, water which may be associated with the use and conservation of water, the energy associated with waste-water treatment, and waste-water reuse. The potential of geothermal resources is reviewed. It is believed the Lake County government can, with the state and Federal government, plan geothermal development. It is also believed the Geysers should be considered as a payoff area. An extensive question and answer session completed the workshop. ERA

(Contracts EX-76-C-01-2114, E(49-18)-2114)

(CONS/2114-3) Avail NTIS HC A12/MF A01

Areas addressed are hardware sharing with the power converter gear, system reliability, impact of cooling and ventilation systems, effects of system rating on auxiliaries costs, and the effects of advances of technology in monitoring and protection devices with the use of large-capacity cells. It was found that the most economic choice for a 10-MW, 40-MWh peaking power battery system using 5-kWh cells consists of a 1620 Vdc, 10-string design. The total cost per kW was found to be a steadily decreasing function of system rating; it was \$325/kW at a 10 MW rating. Water cooling of the battery is the most economic choice for virtually every climate. ERA

HC A06/MF A01

A preliminary design and cost study of a zinc/nickel oxide battery suitable for electric vehicle propulsion was conducted. A state-of-technology four-cell zinc/nickel oxide battery module is specified having the following principal characteristics: Capacity (C/2 rate), 310 Ah, Voltage, 6.4 V, Total energy content (C/2 rate), 1.98 kWh, Weight, 26.4 kg, Specific energy (C/2 rate), 75 Wh/kg, Specific power (sustaining, peak), 68 W/kg, 250 W/kg, Cycle life (60 percent depth at C/2 rate), 500. Battery manufacturing processes and costs are defined for initial pilot production of the state-of-technology zinc/nickel oxide battery. Production of the advanced technology battery in a highly automated dedicated facility is then defined for plant capacity. Preliminary test procedures and standards for cells and batteries are defined including evaluation of basic performance, environmental effects and safety, by means of a comprehensive test matrix. Eric Hirst, Jane Cope, Steve Cohn, William Un, and Robert Hoskins

Apr 1977 68 p refs Sponsored in part by Federal Energy Admin

(Contract W-7405-eng-26)

(ORNL-CON-8) Avail NTIS HC A04/MF A01

An improved version of the ORNL residential energy use model was developed to simulate energy use in the residential sector from 1970 through 2000. The model provides considerable detail on annual energy uses by fuel, end use, and housing type, and also estimates annual equipment installations and ownership, equipment energy requirements, structural thermal integrities, fuel expenditures, equipment costs, and costs for improving thermal integrities on new and existing housing units. Thus, the model provides considerable detail on residential energy uses and associated costs. These details are useful for evaluating alternative energy conservation policies, programs and technologies for their energy and economic effects during the next quarter century

(Contract EY-76-S-02-2983)

(COO-2983-2) Avail NTIS HC A02/MF A01

Significant progress was made in establishing the operability and reliability of major pieces of equipment needed for the production of protein and methane from spent sulfite liquor (SSL). Batch ozonations of SSL were conducted at times varying from 1 to 6 hours at pH's in the range of 10 to 2. These screening experiments consistently indicate that low pH's favor the breakdown of SSL into organic fragments which are more easily assimilated by microorganisms. Approximately 23% of the organics oxidized at all pH levels indicated that pH has no effect on the total oxidation of SSL. Total sulfur content of SSL was not measurably altered by ozonation. The intense brown color of SSL was appreciably removed during ozonation. The contents of the reactor assumed a light brownish-yellow hue during the course of a 4 hour ozonation treatment

**N77-33650**

S H Nelson Dec 1976 80 p refs  
(Contract W-31-109-eng-38)  
(ANL-ES-55) Avail NTIS HC A05/MF A01

Strategies for commercializing customer thermal storage are presented. Storage techniques evaluated are space heating, air conditioning, hot water heating, and interruptible hot water heating. Storage systems involved store off peak electric energy for thermal applications during peak load hours. Analyses of both storage techniques and principal parties affected by storage indicate four barriers: the absence of commercially available air conditioning storage devices, appropriate rates, information on both rates and devices, and widespread utility support. Development of appropriate rates is the key to commercialization. The criteria used to evaluate rate types are maximum combined utility and customer benefits, ease of commercialization, and practical feasibility. Rate types include demand charges, time of use rates, and two forms of load management rates, and the possibility of utility ownership is considered. ERA

**EXPERIMENTAL PROGRAM FOR THE DEVELOPMENT OF PEAT GASIFICATION** Interim Report, 10 Feb. - 30 Jun. 1976

30 Jun 1976 21 p  
(Contract E(49-18)-2489)  
(FE-2489-3, IR-1) Avail NTIS HC A02/MF A01

The physical structure and chemical composition of peat were studied and found to be significantly different from those of coal. It was found that drying and grinding peat decreases its liquid absorption capacity. Toluene was the least absorbed, of fire potential slurry media, followed by acetone, propanol, ethanol, and water. Results show that the total liquid absorbed was only slightly less when it was first soaked briefly in water and then in toluene than in the reverse order. Slurrability tests show that about 67 weight percent toluene is required to make a pumpable slurry. Results of thermobalance tests show that initial devolatilization in nitrogen slows the gasification in hydrogen. ERA

A number of gaps in the energy policy decisionmaking process which show the need for better coordination among agencies carrying out energy functions and for establishing a system of priorities among energy goals are identified. In addition, energy reorganization and several issues which the Congress should address in enacting legislation to reorganize the Federal energy structure are discussed. GRA

**BUILDING ENERGY CONSERVATION PROGRAMS. A PRELIMINARY EXAMINATION OF REGULATORY ACTIVITIES AT THE STATE LEVEL Final Report**

Patrick W Cooke and Robert M Eisenhard Jun 1977 124 p refs Sponsored in part by Federal Energy Admin and ERDA  
(PB-268873/7, NBSIR-77-1259) Avail NTIS  
HC A06/MF A01 CSCL 10A

Background information on the current regulatory status and degree of implementation of building energy conservation programs at the state level are described, including those programs dealing with solar energy. This data base can be drawn upon to promote utilization of building thermal efficiency standards on a uniform basis throughout the country. From information collected in a survey of twenty-one states, the report presents the current state-of-the-art on common problems experienced at the state level in the promulgation and implementation of building energy conservation regulations. Based on these findings, several types of assistance that could facilitate the orderly adoption and implementation of uniform standards are identified. GRA

Edited transcripts of presentations and discussion of plenary sessions of a workshop on public participation in energy related decision making are given. The emergency core cooling system rule making, the consideration of energy parks in Pa and the Seabrook, New Hampshire nuclear station decisions are summarized and the process of public participation in each decision is analyzed by participants in the respective cases. Also summarized are the North Anna decision, the Sears Island decision and the Big Rock Point decision. The focus of the workshop is on the processes of public participation and how it may be improved. GRA

ROLE OF NUCLEAR POWER IN MEETING FUTURE U S  
ENERGY NEEDS**

E A Wiggins 1977 14 p Presented at Intern Conf on Nucl Power and its Fuel Cycles, Salzburg, Austria, 2 May 1977  
(IAEA-CN-36/396, Conf-770505-272) Avail NTIS  
HC A02/MF A01

The likelihood of the U S industry's further commitment to nuclear power vis-a-vis comparable commitments in other parts of the world is considered. Those commitments may be contingent upon closing the nuclear fuel cycle. The extent to which such commitments will be influenced by government policy and regulation, financing and manpower requisites, and the challenge of the critics is also addressed. Finally, this paper points out ways in which nuclear power is already a de facto key to a U S national energy policy and how it can further contribute to the goal of energy independence. ERA

TECHNICAL AND ECONOMIC STUDIES OF SMALL  
REACTORS FOR SUPPLY OF ELECTRICITY AND STEAM**

I Spiewak 1977 17 p refs Presented at Intern Conf on Nucl Power and its Fuel Cycles, Salzburg (Austria), 2 May 1977  
(IAEA-CN-36/398, Conf-770505-269) Avail NTIS  
HC A02/MF A01

Several nuclear steam supply systems in the small and intermediate size range were studied. Detail studies are reported of the Consolidated Nuclear Steam Generator, a 313 MW(t) pressurized water reactor, as applied to industrial energy needs. Both conventional and barge-mounted nuclear steam supply systems are considered. Conceptual studies have been started of pressurized and boiling water reactors in the range of 1000 MW(t), which are envisioned for utility operation for supply of electric power and steam. Design studies of a 500 MW(t) high temperature reactor are also reported. The small reactors are expected to have higher unit costs than the large commercial plants, but to have compensating advantages in high plant availability, shorter construction schedule and greater siting flexibility. Studies are also reported of power cycle parameters and cost allocations for extraction of steam from steam turbine plants. ERA

ENERGY OPTIONS OPEN TO MANKIND BEYOND THE  
TURN OF THE CENTURY**

W Haefele 1977 15 p refs Presented at Intern Conf on Nucl Power and its Fuel cycles, Salzburg, Austria 2 May 1977  
(IAEA-CN-36/538) Avail NTIS HC A02/MF A01

The implications of nuclear waste disposal schemes, the releases of large amounts of conversion heat losses as well as security considerations make it necessary to establish also a broad, long range global context for assessments of nuclear energy. The leading consideration is the evolution of the global energy demand. The growth rate in the industrialized nations, the development of the developing nations, and the population growth are considered in some detail. Also, long range trends from labor intensive economies that are mostly agriculture-oriented to energy and/or capital intensive economies are analyzed. The availability of energy reserves and the potential of energy resources is the second line of analysis. Investment requirements and

implications of various environmental considerations, specifically those that are global in nature, are considered. Several scenarios for the buildup of future energy systems are studied. Energy storage and transportation, capital and foreign currency constraints, and various degrees of centralization respectively decentralization are evaluated. ERA

WORLD ENERGY SUPPLY AND DEMAND AND THE  
FUTURE OF NUCLEAR POWER**

U Jantzie 1977 15 p Presented at Intern Conf on Nucl Power and its Fuel Cycles, Salzburg (Austria) 2 May 1977  
(IAEA-CN-36/583, Conf-770505-339) Avail NTIS  
HC A02/MF A01

The Organization for Economic Cooperation and Development (OECD's) world energy outlook analyzed projected trends in energy demand and supply for the OECD area and other major global regions to 1985. It provides a brief discussion of trends after 1985. OECD energy consumption is projected to grow more slowly than in the past. Conservation effects will increase efficiency of energy use per unit of economic growth. All domestic energy supplies in the OECD are projected to expand faster than in the past. The relative share of non-fossil energy sources in total production will be almost doubled. Assuming moderate economic growth, existing energy policies, and a constant real price for oil, the outlook's reference case projects OECD oil import at 35 million barrels a day by 1985. This level of import demand when combined with the import needs of other oil importing areas, could approach the limit of availability of world oil supplies and as a result cause severe disequilibrium in world energy markets. ERA

NUCLEAR POWER ASPECTS IN AN OIL AND COAL  
PRODUCING COUNTRY**

J Ilijas 1977 24 p refs Presented at Intern Conf on Nucl Power and its Fuel cycles, Salzburg (Austria), 2 May 1977  
(IAEA-CN-36/175, Conf-770505-254) Avail NTIS  
HC A02/MF A01

Known energy reserves and their potential in the Indonesian Archipelago are described. Resources comprise, next to oil, a significant amount of bituminous coal, natural gas, some hydro and geothermal power and some radioactive minerals. The possible use of solar and wind energy on the eastern Indonesian islands is discussed. A number of studies have suggested the use of coal and nuclear power as the most economical resources to replace oil. A number of constraints, for both coal and nuclear power, are discussed. A comparison study is made of coal versus nuclear power under the present local conditions. The prospects of nuclear power are reviewed including the initial steps leading thereto, which have already been taken. In this connection the role of a domestic nuclear industry is being discussed, and also the accelerating effect it may have in the distant future on the growth of electricity from nuclear energy. A study was conducted of the operational reliability of vapor recovery systems at gasoline service stations in San Diego County, California. Periodic inspections at 24 stations were conducted to examine the condition of these systems, to determine their operational status, and to check for detectable gasoline vapor losses from control equipment. The study demonstrated that capture of vapors at the vehicle was more effective with vacuum-assisted systems than with vapor balance systems. However, the reliability of the vacuum-assisted systems was not good in general although there was substantial variation depending upon the type of unit. GRA

**SURVEY OF NUCLEAR FUEL CYCLE ECONOMICS: 1970 - 1985**

B E Prince, J P Peerenboom, and J G Delene Mar 1977 142 p refs

(Contract W-7405-eng-26)

(ORNL-TM-5703) Avail NTIS HC A07/MF A01

Factors are presented that may affect nuclear fuel cycle economics through about 1985. The nuclear fuel cycle was surveyed as to past trends, current problems, and future considerations. Unit costs were projected for each step in the fuel cycle. Nuclear fuel accounting procedures were reviewed, methods of calculating fuel costs were examined, and application was made to Light Water Reactors (LWR) over the next decade. A method conforming to Federal Power Commission accounting procedures and used by utilities to account for backend fuel-cycle costs was described which assigns a zero net salvage to discharged fuel. LWR fuel cycle costs of from 4 to 6 mills/kWhr (1976 dollars) were estimated for 1985. These are expected to reach 6 to 9 mills/kWhr if the effect of inflation is included. ERA

HC A12/MF A01 CSCL 13B

Results of a conceptual design study to establish a baseline design for a modular integrated utility system (MIUS) are presented. The system concept developed a basis for evaluating possible projects to demonstrate an MIUS. For the baseline study, climate conditions for the Washington, D C, area were used. The baseline design is for a high density apartment complex of 496 dwelling units with a planned full occupancy of approximately 1200 residents. Environmental considerations and regulations for the MIUS installation are discussed. Detailed cost data for the baseline MIUS are given together with those for design and operating variations under climate conditions typified by Las Vegas, Nevada, Houston, Texas, and Minneapolis, Minnesota. In addition, results of an investigation of size variation effects, for 300 and 1000 unit apartment complexes, are presented. Only conceptual aspects of the design are discussed. Results regarding energy

savings and costs are intended only as trend information and for use in relative comparisons. Alternate heating, ventilation, and air conditioning concepts are considered in the appendix. Author

# SUBJECT INDEX

ENERGY/A Continuing Bibliography (Issue 16)

JANUARY 1978

## Typical Subject Index Listing

The subject heading is a key to the subject content of the document. The title or title and title extension provides the user with a brief description of the subject matter. The report number helps to indicate the type of document cited (e.g. NASA report translation, NASA contractor report). The issue page and accession numbers are located beneath and to the right of the title, e.g. 13 p0086 N77-10640. Under any subject heading, the accession numbers are arranged in sequence with the IAA accession numbers appearing first.

# AIR CARGO

# SUBJECT INDEX

## AIR CARGO

Flight test development of a helicopter-towed surface delivery system 15 p0317 A77-38006

## AIR CONDITIONING

Fuel economy potential of a combined engine cooling and waste heat driven automotive air-conditioning system 13 p0020 A77-12665

Cooling arrays of circuit cards using heat pipes and forced air diffusers 13 p0031 A77-12766

A unique Rankine-cycle heat pump system 13 p0036 A77-12799

Thermal energy storage for heating and air conditioning 13 p0057 A77-16206

Solar-powered housing unit - Simulation of solar heating and cooling in Saudi Arabia 13 p0078 A77-19110

Combined solar and petroleum energy HVAC system for a commercial building in Dhahran --- Heating, Ventilating and Air Conditioning 13 p0078 A77-19111

Preliminary design data for a solar house in Riyadh, Saudi Arabia 13 p0078 A77-19112

A comparison of solar absorption air conditioning systems 14 p0158 A77-22647

Solar absorption air-conditioning performance in central Ohio 14 p0168 A77-23443

Relationship between heat source temperature, heat sink temperature and coefficient of performance for solar-powered absorption air conditioners 14 p0168 A77-23446

Absorption cycles for air-cooled solar air conditioning 14 p0168 A77-23447

American Society of Heating, Refrigerating and Air-Conditioning Engineers, Annual Meeting, Seattle, Wash., June 27-July 1, 1976, Proceedings 14 p0170 A77-23651

Operational modes of solar heating and cooling systems 14 p0180 A77-25899

Design of a solar heating and cooling system for CSU Solar House II 14 p0181 A77-25902

Continuous solar air conditioning with ammonia/water absorption cycle 14 p0182 A77-26057

The University of Florida solar house 15 p0294 A77-35317

Solar cooling of a Florida welcome station - A demonstration 15 p0294 A77-35319

Cool it, sun --- space heating and cooling 15 p0305 A77-36627

Geothermal heat - instead of electrically powered compression - proposed for cooling a small residence or office building 15 p0335 A77-39818

Energy management for commercial buildings and cooling storage [AIAA 77-1004] 16 p0402 A77-41552

Aerospace and HVAC&R: Spinoff '77 - Reaping the dividends --- Heating, Ventilation, Air Conditioning, and Refrigeration 16 p0427 A77-45918

The test reference year: A collection of hourly values of interesting weather elements. III - Conversion of the air pressure for other altitudes, equations of the vapor pressure of water, calculation of the position of the sun --- for heating and air conditioning systems design 16 p0441 A77-48258

The design of a sodium sulfate decahydrate heat exchanger for coolness storage --- in solar-powered air conditioning system 16 p0450 A77-48760

The Page-Jackson Elementary School solar heating and cooling system 16 p0462 A77-48851

The current technology for solar heating and cooling 16 p0470 A77-48919

Parametric study of a dynamic solar powered absorption cycle 16 p0475 A77-48961

Modelling of a solar-operated absorption air conditioner system with refrigerant storage 16 p0475 A77-48963

Steady-state and transient performance limitations of the ARKLA Solar absorption cooling system 16 p0478 A77-48987

The solar fan - Solar induced draft air conditioning system 16 p0478 A77-48988

Solar air conditioning applications for warm humid climate 16 p0496 A77-49147

Solar hot water systems application to the solar building test facility and the Tech House 13 p0084 N77-10342

CCMS solar energy pilot study solar heating and cooling systems in buildings [UMD-4908-5] 13 p0088 N77-10657

A location matrix plan for the residential solar heating and cooling demonstration program. Volume 1: Findings and recommendations [PB-253784/3] 13 p0089 N77-10673

Hybrid simulation of solar HVAC system for house retro-fit design [PB-252608/5] 13 p0090 N77-10676

National program for solar heating and cooling (residential and commercial applications) [ERDA-23A] 13 p0098 N77-11540

Temperature distribution of a hot water storage tank in a simulated solar heating and cooling system [NASA-TM-X-73549] 13 p0106 N77-12521

Evaluation of the air-to-air heat pump for residential space conditioning [PB-255652/0] 13 p0108 N77-12545

The design of a solar energy collection system to augment heating and cooling for a commercial office building [NASA-TM-X-72753] 14 p0207 N77-16446

Optimization of absorption air-conditioning for solar energy applications [NASA-CR-150176] 14 p0210 N77-17560

Potential environmental impacts of solar heating and cooling systems [PB-259970/2] 14 p0226 N77-19683

General Electric Company proposed management plan, commercial buildings, National Solar Demonstration Program [COO-2683-76-3] 14 p0229 N77-20568

General Electric Company proposed demonstration Projects Matrix, commercial buildings, National Solar Demonstration Program [COO-2683-76-5] 14 p0230 N77-20569

Proposed management plan, commercial buildings --- solar heating and cooling demonstration [COO-2683-76-8] 14 p0230 N77-20570

Proposed test and evaluation plan, commercial buildings --- solar heating and cooling demonstration [COO-2683-76-9] 14 p0230 N77-20571

Proposed demonstration Projects Matrix, commercial buildings --- solar heating and cooling demonstration [COO-2683-76-10] 14 p0230 N77-20572

Proceedings of First Semiannual EPRI Solar Program Review Meeting and Workshop. Volume 1: Solar heating and cooling of buildings [PB-260594/7] 14 p0252 N77-21121

A location matrix plan for the residential solar heating and cooling demonstration program. Volume 2: Procedures and appendices [PB-262646/3] 15 p0374 N77-25666

Evaluation of initial collector field performance at the Langley Solar Building Test Facility [NASA-TM-X-73677] 15 p0378 N77-26617

Comparative performance of solar heating with air liquid systems [COO-2868-1] 15 p0383 N77-26676

National program plan for research and development in solar heating and cooling [ERDA-76-144] 16 p0514 N77-28597

National program for solar heating and cooling of buildings [ERDA-76-6] 16 p0515 N77-28604

Tropospheric oxidation H2S  
16 p0411 A77-42254

Energy reduction in cleaning exhausts containing particulates and noxious gases  
16 p0414 A77-42740

Control of air pollution sources --- Book  
16 p0419 A77-43522

Atmospheric pollution due to multi-stack emissions of medium and large-capacity thermal or thermoelectric plants  
16 p0420 A77-44178

Catalytic action of combustion-product deposits in the oxidation of SO2 to SO3 within the combustion chambers and exhaust channels of thermoelectric plants  
16 p0420 A77-44179

Computer predicted compression ratio effects on NOx emissions from a methanol fueled SI engine  
16 p0444 A77-48706

Exhaust and evaporative emission from a Brazilian Chevrolet fueled with ethanol-gasoline blends  
16 p0444 A77-48708

Pollution control in geothermal energy  
16 p0452 A77-48772

Impact of air quality regulation on the electric power industry  
16 p0452 A77-48775

Power generation: Air pollution monitoring and control --- Book  
16 p0504 A77-51126

Eliminate source emission codes for coal-refuse fired power plants  
16 p0504 A77-51128

Airborne and mobile ground level measurements of pollutants in the sphere of influence of a coal-fired electric generating station  
16 p0504 A77-51135

Air pollution control for industrial coal-fired boilers  
16 p0504 A77-51152

Mathematical modelling of coal combustion in fluidized beds with sulphur emission control by limestone or dolomite  
16 p0508 A77-51587

A 1977 approach to sulfur oxide emissions [ASME PAPER 77-JPGC-PWR-1] 16 p0508 A77-51621

Protocol to characterize gaseous emissions as a function of fuel and additive composition [PB-253363/6] 13 p0084 A77-10221

Fuels and fuel additives for highway vehicles and their combustion products. Guide to evaluation of their potential effects on health [PB-254088/8] 13 p0084 A77-10222

Mathematical simulation and empirical determination of the aerochemical and thermal atmospheric pollution resulting from energy conversion processes [DLR-IB-553-75/1] 13 p0091 A77-10700

The proceedings of the NOx Control Technology Seminar [PB-253661/3] 13 p0092 A77-10707

Growth effects of major land use projects. Volume 2: Compilation of land use based emission factors [PB-255302/2] 13 p0092 A77-10709

Chemical and physical characterization of automotive exhaust particulate matter in the atmosphere [PB-253375/0] 13 p0092 A77-10715

Cost analysis of two air quality attainment strategies [PB-254182/9] 13 p0092 A77-10719

The chemistry, dispersion, and transport of air pollutants emitted from fossil fuel power plants in California [PB-254449/2] 13 p0092 A77-10720

Reductant gases for flue gas desulfurization systems [PB-254168/8] 13 p0092 A77-10722

Compilation of air pollutant emission factors. Supplement [PB-254274/4] 13 p0093 A77-10731

- Field test sampling/analytical strategies and implementation cost estimates: Coal gasification and flue gas desulfurization [PB-254466/2] 13 p0101 N77-11581
- An evaluation of high altitude engine modification devices (econo-kit) [PB-255556/3] 13 p0101 N77-11589
- Investigation and assessment of light-duty-vehicle evaporative emission sources and control [PB-255813/8] 13 p0102 N77-11603
- A bioenvironmental study of emissions from refuse derived fuel [AD-A024661] 13 p0110 N77-12571
- Air quality considerations in transportation planning: Findings and recommendations on transportation control planning, phase 2 [PB-256424/3] 13 p0110 N77-12576
- Laws and regulations affecting coal with summaries of Federal, State, and local laws and regulations pertaining to air and water pollution control, reclamation, diligence and health and safety, part 1 [PB-255927/6] 13 p0110 N77-12592
- Proceedings: Symposium on Flue Gas Desulfurization, volume 1 [PB-255317/0] 13 p0110 N77-12597

# AIR SAMPLING

# SUBJECT INDEX

Northeastern utilities are meeting the clean air challenge  
16 p0424 A77-44612

Cost analysis of two air quality attainment strategies  
[PB-254182/9] 13 p0092 N77-10719

The air quality and economic implications of supplementary control systems in Illinois --- considering electric power plant fuels  
[PB-255699/1] 13 p0101 N77-11588

## AIR SAMPLING

Airborne and mobile ground level measurements of pollutants in the sphere of influence of a coal-fired electric generating station  
16 p0504 A77-51135

Initial environmental test plan for source assessment of coal gasification  
[PB-261916/1] 15 p0350 N77-22705

Environmental assessment sampling and analytical strategy program --- industrial wastes  
[PB-261259/6] 15 p0352 N77-23021

## AIR TO AIR MISSILES

Performance optimization of an air-to-air missile design  
15 p0289 A77-34298

## AIR TRAFFIC CONTROL

LH2 airport requirements study  
[NASA-CR-2700] 13 p0083 N77-10032

Report to congress by the Federal Aviation Administration on the energy efficiency of agency regulations  
[AD-A034611] 15 p0359 N77-24103

## AIR TRANSPORTATION

Air transportation energy efficiency - Alternatives and implications  
[SAWE PAPER 1124] 13 p0016 A77-12192

Transport of the future and the tasks of science  
13 p0048 A77-13643

Air transportation and fuel consumption  
13 p0051 A77-14563

LTA - Recent developments --- Lighter Than Air ships  
13 p0061 A77-17021

Regulatory reform of air transportation  
[AIAA PAPER 77-276] 13 p0065 A77-18215

The future of air transportation - Economic association considerations  
[AIAA PAPER 77-286] 13 p0065 A77-18222

Our amazing air transportation system /AIAA-SAE William Littlewood Memorial Lecture/ --- civil aviation aircraft historical overview  
[AIAA PAPER 77-356] 13 p0067 A77-18260

Effects of selected R&D options on fuel usage in the commercial air system  
14 p0201 A77-29472

Report on Joint Conference Eno Foundation Board of Directors and Board of Consultants, October 13 and 14, 1976  
15 p0260 A77-31064

Some early perspectives on ground requirements of liquid hydrogen air transports  
15 p0281 A77-33391

Flight test development of a helicopter-towed surface delivery system  
15 p0317 A77-38006

Have energy, will travel --- alternative aviation energy sources in the future  
16 p0409 A77-41933

Competitive restraints on air travel - Ground modes and telecommunications  
16 p0409 A77-41939

A view of the future - Constraints and opportunities --- aviation effects on world structure  
16 p0410 A77-41944

The aircraft energy efficiency active controls technology program  
[AIAA 77-1076] 16 p0415 A77-42784

Baseline energy forecasts and analysis of alternative strategies for airline fuel conservation  
[PB-255351/9] 13 p0091 N77-10690

Future aircraft requirements: A notebook of airline thoughts  
13 p0117 N77-13976

Air transport propulsion for the 1980's  
13 p0117 N77-13980

Air transportation beyond the 1980's  
13 p0117 N77-13984

Domestic and world trends (1980 - 2000) affecting the future of aviation  
[NASA-CR-144838] 13 p0126 N77-14981

Study of the cost/benefit tradeoffs for reducing the energy consumption of the commercial air transportation system  
[NASA-CR-137926] 13 p0126 N77-15007

Study of the cost/benefit tradeoffs for reducing the energy consumption of the commercial air transportation system  
[NASA-CR-137927] 13 p0126 N77-15008

Cost/benefit tradeoffs for reducing the energy consumption of the commercial air transportation system. Volume 1: Technical analysis  
[NASA-CR-137923] 15 p0353 N77-23072

Factors affecting the corporate decisionmaking process of air transport manufacturers  
[NASA-CR-154618] 15 p0387 N77-27020

## AIRBORNE EQUIPMENT

LTA - Recent developments --- Lighter Than Air ships  
13 p0061 A77-17021

Tracking pollutants from a distance  
13 p0067 A77-18370

## AIRBORNE/SPACEBORNE COMPUTERS

Power supplies for full time fly-by-wire aircraft control systems  
15 p0320 A77-38461

## AIRCRAFT CONFIGURATIONS

The next-generation subsonic transport  
[SAWE PAPER 1127] 13 p0016 A77-12195

## AIRCRAFT CONSTRUCTION MATERIALS

Composite technology - The boom is under way --- rotorcraft materials  
15 p0287 A77-33616

## AIRCRAFT CONTROL

Power supplies for full time fly-by-wire aircraft control systems  
15 p0320 A77-38461

## AIRCRAFT DESIGN

Estimating procedures associated with aircraft modifications  
[SAWE PAPER 1101] 13 p0016 A77-12181

Application of advanced technology to future long-range aircraft  
[SAWE PAPER 1126] 13 p0016 A77-12194

The next-generation subsonic transport  
[SAWE PAPER 1127] 13 p0016 A77-12195

Hypersonic technology-approach to an expanded program  
13 p0051 A77-14597

Layout and flight performance of a hypersonic transport /HST/  
[DGLR PAPER 76-198] 13 p0060 A77-16575

Technical highlights in general aviation  
[AIAA PAPER 77-312] 13 p0066 A77-18237

Our amazing air transportation system /AIAA-SAE William Littlewood Memorial Lecture/ --- civil aviation aircraft historical overview  
[AIAA PAPER 77-356] 13 p0067 A77-18260

The pay-off for advanced technology in commercial aircraft design and operation  
13 p0071 A77-19012

The dynamics of STOL /The Daniel and Florence Guggenheim Lecture/ --- utility aircraft for short haul service in remote areas  
[ICAS PAPER 76-01] 13 p0081 A77-19247

Energy and economic trade offs for advanced technology subsonic aircraft  
14 p0201 A77-29471

Fundamentals of aerodynamic design: Propellers /2nd enlarged edition/ --- Serbo-Croatian book  
15 p0317 A77-37949

Evaluation of propulsive lift enhancement and variable cycle engines for advanced tactical aircraft  
[AIAA PAPER 77-885] 15 p0321 A77-38575

Design of a large span-distributed load flying-wing cargo airplane  
[NASA-TN-X-74031] 15 p0353 N77-23089

Innovative Aircraft Design Study (IADS) task 2, volume 1  
[AD-A041234] 16 p0531 N77-31141

An overview of concepts for aircraft drag reductions  
16 p0543 N77-32092

## AIRCRAFT ENGINES

Equation solution accuracy in calculating jet engine characteristics  
13 p0020 A77-12502

# SUBJECT INDEX

# AIRCRAFT FUELS

Application of simulation studies to the design and improvement of fuel control systems for aviation turbine engines 13 p0054 A77-15798

Pressure ratio optimization criteria in aircraft turbojet-engines design 13 p0062 A77-17258

Variable geometry for high performance aircraft engines 13 p0062 A77-17264

A combined-cycle with a partial-oxidation reactor 13 p0062 A77-17534

Theoretical aspects of optimization of aviation gas turbine engine design variables 13 p0063 A77-17762

Air transport propulsion for the 1980's 14 p0138 A77-20717

The propulsion system of the aircraft Z-37. I 14 p0156 A77-22121

An engine designer's view for advanced secondary power systems [AIAA PAPER 77-517] 14 p0174 A77-23931

Piat petrol engine performance with a mixture of basil extract with petrol 14 p0179 A77-25196

Influence of the intended use of an aircraft on the optimal parameters of gas-turbine power plants 15 p0266 A77-32086

Future propulsion plants. I 15 p0268 A77-32251

Automotive engines - A viable alternative for aircraft [SAE PAPER 770466] 15 p0310 A77-37084

The M-14P aircraft engine --- Russian book 15 p0320 A77-38300

Aviation transportation and atmospheric pollution [ONERA, TP NO. 1977-79] 15 p0321 A77-38533

Evaluation of propulsive lift enhancement and variable cycle engines for advanced tactical aircraft [AIAA PAPER 77-885] 15 p0321 A77-38575

Advanced supersonic transport propulsion requirements [AIAA PAPER 77-831] 16 p0410 A77-41969

Testing the annular combustor of the NK-8 aero-engine on natural gas --- for stationary gas turbine installation 16 p0426 A77-45325

Bosch technical instruction. Gasoline injection D and L-jetronic [NASA-TT-P-17111] 13 p0095 A77-11399

Auxiliary power system for activity cooled aircraft [NASA-CASE-LAR-11626-1] 13 p0103 A77-12332

Cost/benefit assessment of the application of composite materials to subsonic commercial transport engines [NASA-TN-X-73557] 13 p0111 A77-13064

Air transport propulsion for the 1980's 13 p0117 A77-13980

Study of unconventional aircraft engines designed for low energy consumption [NASA-CR-135136] 13 p0127 A77-15043

Aircraft power supplies and cooling problems: A viewpoint from the power conditioner designer 14 p0207 A77-16039

Variable Geometry and Multicycle Engines [AGARD-CP-205] 15 p0339 A77-22112

Advanced engine design concepts and their influence on the performance of multi-role combat aircraft 15 p0339 A77-22116

Variable cycle engines for V/STOL fighters 15 p0339 A77-22117

Variable cycle engine applications and constraints --- for commercial and military (fighter) aircraft 15 p0339 A77-22125

High efficiency engine cycles for air transport fuel economy 15 p0339 A77-22126

Multi-mission uses for prop-fan propulsion 15 p0339 A77-22127

The pros and cons of variable geometry turbines 15 p0340 A77-22140

Potential improvements in engine performance using a variable geometry turbine 15 p0340 A77-22141

Performance, emissions, and physical characteristics of a rotating combustion aircraft engine [NASA-CR-135119] 15 p0376 A77-26134

AIRCRAFT EQUIPMENT

Electrochemical battery trends for aircraft and missile applications [AIAA PAPER 77-481] 14 p0172 A77-23901

Development of nickel-zinc batteries for aircraft 14 p0195 A77-28148

A study of the failure of joints in composite material fuel cells due to hydraulic ram loading [AD-A027258] 13 p0117 A77-14016

AIRCRAFT FUEL SYSTEMS

The fuel approach to control emissions from aircraft [IAF PAPER 76-111] 13 p0003 A77-10911

The technical concept of the IL-62M. II - Fuel system 14 p0156 A77-22120

The M-14P aircraft engine --- Russian book 15 p0320 A77-38300

National Airlines Fuel Management and Allocation Model 16 p0419 A77-43399

Aircraft fuel conservation technology. Task force report, September 10, 1975 [NASA-TN-X-74295] 13 p0093 A77-11055

Reduction of gaseous pollutant emissions from gas turbine combustors using hydrogen-enriched jet fuel [NASA-CR-149146] 13 p0094 A77-11198

Fuel subsystem characteristics for LH2 aircraft 14 p0243 A77-21630

AIRCRAFT FUELS

Air transportation energy efficiency - Alternatives and implications [SAE PAPER 1124] 13 p0016 A77-12192

Survey of hydrogen energy application projects 13 p0033 A77-12778

Air transportation and fuel consumption 13 p0051 A77-14563

- ATMOSPHERIC CIRCULATION**  
Aerothermic power plant with artificial cyclone  
13 p0077 A77-19098
- ATMOSPHERIC COMPOSITION**  
Atmospheric carbon dioxide variations at the South Pole  
13 p0067 A77-18439  
Distribution of some hydrocarbons in ambient air near Delft and the influence on the formation of secondary air pollutants  
15 p0271 A77-32954  
Tropospheric oxidation H<sub>2</sub>S  
16 p0411 A77-42254  
Airborne and mobile ground level measurements of pollutants in the sphere of influence of a coal-fired electric generating station  
16 p0504 A77-51135
- ATMOSPHERIC DIFFUSION**  
Comparison of calculated and measured maximum aboveground air pollutant concentrations and their respective distances from the source of release of large power plants  
[ORNL-TR-4231]  
15 p0386 N77-26712  
Modelling the atmospheric dispersal of radioactive pollutants beyond the first few hours of travel  
15 p0395 N77-27603
- ATMOSPHERIC EFFECTS**  
Meteorological data regarding the utilization of solar energy  
14 p0202 A77-29563  
Effects of nitrogen fertilizers and combustion on the stratospheric ozone layer  
15 p0290 A77-34895  
Space-borne power conversion into a microwave beam and its impact on the environment of the upper atmosphere  
16 p0464 A77-48875  
Sensitivity of solar-cell performance to atmospheric variables. 1: Single cell  
[NASA-CP-2010]  
15 p0378 N77-26623  
Sensitivity of solar-cell performance to atmospheric variables. 2: Dissimilar cells at several locations  
[NASA-CP-2010]  
15 p0379 N77-26624
- ATMOSPHERIC HEAT BUDGET**  
Energetics of the midlatitude thermosphere  
13 p0012 A77-11492  
Stratospheric heating due to absorption of solar radiation by NO<sub>2</sub>  
13 p0013 A77-11568
- ATMOSPHERIC HEATING**  
Stratospheric heating due to absorption of solar radiation by NO<sub>2</sub>  
13 p0013 A77-11568  
The influence of subsurface energy storage on seasonal temperature variations  
13 p0067 A77-18351  
Atmospheric impacts of evaporative cooling systems  
[NRL-ES-53]  
15 p0367 N77-24643
- ATMOSPHERIC MODELS**  
The influence of subsurface energy storage on seasonal temperature variations  
13 p0067 A77-18351  
Wind power prediction models  
[NASA-CR-149235]  
13 p0105 N77-12509
- ATMOSPHERIC MOISTURE**  
Electric energy from atmospheric water vapor  
13 p0077 A77-19097  
Energy from humid air  
[AIAA PAPER 77-730]  
15 p0311 A77-37253  
Sensitivity of solar cell performance to atmospheric variables. 1: Single cell  
16 p0527 N77-30534
- ATMOSPHERIC OPTICS**  
Experimental and theoretical studies on solar energy for energy conversion  
16 p0471 A77-48932
- ATMOSPHERIC PHYSICS**  
Atmospheric ice nuclei - No detectable effects from a coal-fired powerplant plume  
13 p0054 A77-15780
- ATMOSPHERIC PRESSURE**  
The test reference year: A collection of hourly values of interesting weather elements. III - Conversion of the air pressure for other altitudes, equations of the vapor pressure of water, calculation of the position of the sun --- for heating and air conditioning systems design  
16 p0441 A77-48258
- ATMOSPHERIC RADIATION**  
Comparative discussion on measurements of atmospheric natural radioactivity and pollution by coal smoke particles  
15 p0294 A77-35349  
Insolation data for solar energy conversion derived from satellite measurements of earth radiance  
16 p0471 A77-48930
- ATMOSPHERIC REFRACTION**  
Servo positioning power tower collectors for solar heat conversion to electricity  
14 p0198 A77-28811  
Solar energy: L-division miscellaneous  
[UCID-17177]  
14 p0231 N77-20590
- ATMOSPHERIC SCATTERING**  
Results from circumsolar radiation measurements  
[LBL-5292]  
15 p0382 N77-26657
- ATMOSPHERIC TEMPERATURE**  
The influence of subsurface energy storage on seasonal temperature variations  
13 p0067 A77-18351  
Aerothermic power plant with artificial cyclone  
13 p0077 A77-19098  
Insolation and temperature statistics and their influence on the design of solar heating systems and the electric utility interface  
16 p0479 A77-49000
- ATMOSPHERIC WINDOWS**  
Infrared extinction spectra of some common liquid aerosols  
15 p0290 A77-34561
- ATOMIC BEAMS**  
Neutral injection at PPPL, past and present --- in toroidal plasma devices  
16 p0407 A77-41698
- ATOMIC PHYSICS**  
Report of the subcommittee on energy-related atomic and molecular science  
[PB-264052/2]  
15 p0375 N77-25673
- ATS**  
The ATS-6 power system - Hardware implementation and orbital performance  
13 p0040 A77-12831
- ATS 6**  
The ATS-6 power system: Hardware implementation and orbital performance  
[NASA-TP-1023]  
16 p0543 N77-32229
- ATTITUDE CONTROL**  
Servo positioning power tower collectors for solar heat conversion to electricity  
14 p0198 A77-28811  
An energy management guidance scheme applicable to the interim upper stage --- for orbital transfer maneuvers  
[AD-A034005]  
15 p0353 N77-23143
- ATTITUDE STABILITY**  
Nuclear-powered Hysat spacecraft: Comparative design study  
[ERDA-SRS-3063-8]  
13 p0094 N77-11108
- AUGER SPECTROSCOPY**  
Ternary compound thin film solar cells  
[PB-262536/6]

Health effects of pollutants associated with  
fossil-fuel power generation: An indexed  
bibliography with abstracts

[UCD-472-500] 16 p0540 N77-31672

In-situ coal gasification: Status of technology  
and environment impact

[PB-268576/6] 16 p0548 N77-32613

Reclamation of energy from solid waste: Theory  
and practice. A selected, annotated  
bibliography for Pennsylvania local government  
officials

[PB-267800/1] 16 p0555 N77-33621

## BINARY ALLOYS

Thermal storage in metals

16 p0492 A77-49105

## BINARY FLUIDS

Investigation of heat exchanger flow arrangement  
on performance and cost in a geothermal binary  
cycle

13 p0029 A77-12746

Investigation of heat exchanger flow arrangement  
on performance and cost in a geothermal binary  
cycle

[UCRL-78390] 14 p0221 N77-19587

Modeling and optimization of geothermal power  
plants using the binary fluid cycle

[BNWL-2112] 16 p0521 N77-29609

## BIOASSAY

JP-4 and JP-9 fuel toxicity studies using water  
fish and aufwuchs

[AD-A027594] 13 p0127 N77-15213

## BIOCHEMICAL FUEL CELLS

Fuels via bioconversion

14 p0176 A77-24569

## BIOCHEMISTRY

Feasibility studies of a biochemical  
desulfurization method --- using microorganisms  
as agent from high sulfur containing petroleum

14 p0170 A77-23562

Microbial hydrogen production

15 p0278 A77-33367

## BIODEGRADATION

SWG from refuse and sewage sludge by the BIOGAS  
process

15 p0314 A77-37659

Synthetic natural gas from animal wastes by  
anaerobic fermentation

15 p0314 A77-37660

Fuel gas from landfill

15 p0314 A77-37661

Quantitative studies on marine biodegradation of  
oil. III - Comparison of different crude oil  
residues and effects of sea water source

16 p0425 A77-44675

The origin of the oil sand bitumens of Alberta - A  
chemical and a microbiological simulation study

16 p0438 A77-47765

Heat treatment of refuse for increasing anaerobic  
biodegradability

[PB-252924/6] 13 p0101 N77-11577

Thermal effects on biodegradation of pollutants in  
water

[PB-261512/8] 15 p0350 N77-22709

The biodegradation of oil in sea water for naval  
pollution control

[AD-A042375] 16 p0560 N77-33688

## BIOLOGICAL EFFECTS

Effects of anthropogenic emissions on climate - A  
review of selected topics

13 p0067 A77-18295

Effects of thermal pollution on certain aquatic  
invertebrates

[PB-263488/9] 15 p0368 N77-24673

Ecological review of hydroelectric reservoirs in  
Puerto Rico

[CEER-1] 16 p0540 N77-31673

## BIOLOGICAL EVOLUTION

The paleoprotophobic origin of energy metabolism  
--- chemiosmotic precursor to phototropism in  
estuarine cellular organisms

13 p0064 A77-17895

## BIOMASS ENERGY PRODUCTION

The long-range prospects for solar-derived fuels

13 p0017 A77-12240

Solar SWG - Large-scale production of SWG by  
anaerobic digestion of specially grown plant  
matter --- Synthetic Natural Gas

13 p0021 A77-12671

Solar energy collection by bioconversion

13 p0021 A77-12672

Nuclear power for the production of synthetic  
fuels and feedstocks

13 p0035 A77-12790

Solar energy utilization - The photochemical  
approach

13 p0075 A77-19076

Formulation of energy policies - The case of West  
Africa

13 p0080 A77-19124

Alcohol - A Brazilian answer to the energy crisis  
--- automobile fuel from manioc

14 p0145 A77-21673

Clean fuels from biomass

14 p0167 A77-23390

Fuels via bioconversion

14 p0176 A77-24569

Energy from bio-conversion for developing countries

15 p0270 A77-32592

Energy from the oceans - Requirements and  
capabilities

15 p0272 A77-33141

Solar energy prospects grow for US southwest

15 p0297 A77-36049

China claims lead in biogas energy supply

15 p0297 A77-36050

Clean fuels from biomass, sewage, urban refuse,  
agricultural wastes; Proceedings of the  
Symposium, Orlando, Fla., January 27-30, 1976

15 p0313 A77-37652

## SUBJECT INDEX

## BOILERS

Wastes and biomass as energy resources - An overview  
15 p0313 A77-37654

The conversion of ocean farm kelp to methane and  
other products  
15 p0314 A77-37662

An economic assessment of fuelgas from water  
hyacinths  
15 p0314 A77-37663

Energy from agriculture  
15 p0314 A77-37664

Gas production from micro algae  
15 p0314 A77-37665

Enzymatic hydrolysis of cellulosic wastes to  
fermentable sugars for alcohol production  
15 p0315 A77-37666

Design, operation and economics of the energy  
plantation  
15 p0315 A77-37667

Federal Fuels from Biomass Energy  
Program  
15 p0315 A77-37670

Fuels from biomass - Energy outlay versus energy  
returns: A critical appraisal  
15 p0322 A77-38673

Energy from bioconversion of waste materials ---  
Book  
16 p0407 A77-41649

Photosynthetic solar energy - Rediscovering  
biomass fuels  
16 p0421 A77-44396

Biomass energy for Hawaii. Volume 1 - Summary and  
background. Volume 2 - Sugar operations. Volume  
3 - Mixed municipal refuse. Volume 4 -  
Terrestrial and marine plantations --- Book  
16 p0428 A77-46250

Methane production from solid waste  
16 p0434 A77-47218

Cassava fuel alcohol in Brazil  
16 p0444 A77-48707

Solid fuels from biomass - Some environmental and  
economic considerations  
16 p0445 A77-48712

The prospects for fuels from biomass  
16 p0445 A77-48713

The photosynthesis energy factory - Analysis,  
synthesis, and demonstration  
16 p0449 A77-48753

Recent Canadian activities in biomass  
16 p0470 A77-48917

Fuels and chemicals from the sun through  
bioconversion  
16 p0488 A77-49076

Silviculture energy plantations  
16 p0488 A77-49079

Field crops as a future source of fuels and  
chemical feedstocks  
16 p0489 A77-49080

Methane production through bioconversion of  
agriculture residues  
16 p0489 A77-49081

A feasibility study of bio-gas production in  
individual farms in Southwestern Ontario  
16 p0489 A77-49082

Agricultural and forestry wastes as an energy  
resource  
16 p0489 A77-49083

Perpetually renewable biomass prospects - A  
comparison of U.S. and Canadian ecosystem  
carrying capacities vs needs  
16 p0489 A77-49084

Rural energy centre for Africa using solar, wind  
and biogas energies  
16 p0496 A77-49139

Design, operation and economics of the Energy  
Plantation  
16 p0497 A77-49154

Fuel and energy production by bioconversion of  
waste materials: State-of-the-art  
[PB-258499/3]  
14 p0219 A77-19279

Biosolar production of fuels from algae  
[UCRL-52177]  
16 p0511 A77-28323

Unconventional energy sources  
[PB-268301/9]  
16 p0548 A77-32617

Marine pastures: A by-product of large (100  
megawatt or larger) floating ocean-thermal power  
plants  
[COO-2581-3]  
16 p0555 A77-33625

**BIO MEDICAL DATA**  
Balanced program plan. Volume 4: Coal conversion  
[ORNL-5123-VOL-4]  
14 p0216 A77-18566

Coal conversion: Description of technologies and  
necessary biomedical and environmental research  
[ORNL-5192]  
15 p0392 A77-27520

**BIOSPHERE**  
Effects of anthropogenic emissions on climate - A  
review of selected topics  
13 p0067 A77-18295

**BIOTECHNOLOGY**  
Industrial development in zero-G  
15 p0295 A77-35812

**BISMUTH**  
Heat-pipe bismuth laser; examination of laser  
action at 4722 Å in bismuth vapor  
[AD-A039568]  
16 p0533 A77-31495

**BITUMENS**  
Catalytic coal liquefaction using synthesis gas  
13 p0059 A77-16473

Path of development and developmental status of  
the lignite high-temperature coking process in  
the DDR - An example of effective utilization of  
lignite as energy vehicle  
14 p0163 A77-23096

Sulfur compounds in oils from the Western Canada  
Tar Belt  
14 p0169 A77-23553

Characterization of a Utah tar sand bitumen  
14 p0170 A77-23561

Combustion of pulverized, solvent-refined coal  
[ASME PAPER 76-WA/FU-6]  
14 p0185 A77-26456

The Riley-Morgan gasifier  
14 p0193 A77-27298

The Asphalt Ridge tar-sand deposits  
14 p0193 A77-27347

Recovery of bitumen from oil-impregnated sandstone  
deposits of Utah  
14 p0194 A77-27349

Multi-stage activation of brown-coal chars with  
oxygen  
16 p0401 A77-41319

The origin of the oil sand bitumens of Alberta - A  
chemical and a microbiological simulation study  
16 p0438 A77-47765

**BLACK BODY RADIATION**  
Thermodynamic constraints, effective temperatures  
and solar cells  
14 p0147 A77-21779

A geometrical spectral selective window --- for  
conversion of solar energy into heat  
14 p0148 A77-21793

**BLACK BRANT SOUNDING ROCKETS**  
The International Heat Pipe Experiment --- Black  
Brant sounding rocket payload zero gravity  
experiment  
13 p0120 A77-14389

**BLUE GREEN ALGAE**  
The photosynthetic production of hydrogen  
15 p0278 A77-33368

Biosolar production of fuels from algae  
[UCRL-52177]  
16 p0511 A77-28323

**BOILERS**  
Influence of heavy fuel oil composition and boiler  
combustion conditions on particulate emissions  
13 p0008 A77-11162

Steam station repowering - A near-term method of  
energy conservation  
13 p0022 A77-12679

Alternate fuel capability of Rankine cycle engines  
13 p0036 A77-12801

Heat tests with a GT-35 gas turbine as an element  
of steam-gas facility with a high-pressure steam  
generator  
14 p0136 A77-20109

Utilization of disposed petroleum products and  
industrial wastes as fuels  
14 p0167 A77-23404

Coal-in-oil - A substitute boiler fuel  
[ASME PAPER 76-WA/FU-2]  
14 p0185 A77-26453

Combined utilization of nuclear and organic fuels  
15 p0272 A77-33159

Formation of sulfuric anhydride and nitrogen  
oxides in boilers at variable operating modes  
15 p0272 A77-33174

Hydrogen production process by means of nuclear  
energy  
15 p0273 A77-33327

The aqueous homogeneous reactor as a source of  
hydrogen and of process heat  
15 p0274 A77-33329

Hydrogen production from nuclear waste energy  
15 p0274 A77-33331

Solar tower characteristics  
15 p0274 A77-33333

State of the art of particulate and SO<sub>2</sub> removal on  
coal fired boilers  
15 p0293 A77-35167

1-MW solar boiler tested  
15 p0303 A77-36349

Solar energy systems of the tower type -  
Arrangement and heat-stability of the receivers  
and steam generators  
15 p0316 A77-37770

Development and testing of solar water-heating  
boilers manufactured by diffusion welding  
15 p0316 A77-37773

Solar heating in residential houses in Uzbekistan  
15 p0316 A77-37774

Producer gas from agricultural wastes - Its  
production and utilization in a converted  
oil-fired boiler  
15 p0323 A77-39106

Status of the reference dual-cycle MHD-steam power  
plant  
15 p0332 A77-39577

Energy recovery by the incineration of solid waste -  
Development, present status and experiences in  
Germany  
15 p0334 A77-39675

Dynamic characteristics of the desulfurization  
plant boiler draft system for power stations  
15 p0338 A77-40201

A tower-type solar power plant - Configuration and  
thermal-regime stability of receivers and steam  
generators  
16 p0437 A77-47426

Development and testing of solar water-heater  
boilers fabricated by diffusion welding  
16 p0437 A77-47429

Residential solar heating in Uzbekistan  
16 p0437 A77-47430

A unitized 500-megawatt fluidized bed boiler design  
16 p0453 A77-48786

Dynamic modeling of fluidized bed boilers for  
control system design  
16 p0454 A77-48792

Solar powered steam generation  
16 p0459 A77-48832

1 MWth solar cavity steam generator solar test  
program  
16 p0461 A77-48846

Central receiver solar thermal power  
16 p0484 A77-49037

Demand sensitive energy storage in molten salts  
16 p0491 A77-49102

Air pollution control for industrial coal-fired  
boilers  
16 p0504 A77-51152

Study of the feasibility of federal procurement of  
fuels produced from solid wastes  
[PB-255695/9]  
13 p0096 N77-11513

Assessment of the impact of proposed thermal  
effluent guidelines for the steam electric power  
industry  
[PB-255937/5]  
13 p0110 N77-12587

Design phase utility analysis for gas turbine and  
combined cycle plants  
[PB-256665/1]  
13 p0115 N77-13553

Performance of emission control devices on boilers  
firing municipal solid waste and oil  
[PB-257136/2]  
13 p0133 N77-15550

Technical and economic feasibility of solar  
augmented process steam generation  
[COO-2732-1]  
14 p0250 N77-21692

Assessment of the potential for energy  
conservation through improved industrial boiler  
efficiency, volume 1  
[PB-262576/2]  
15 p0374 N77-25665

Energy Conversion Alternatives Study (ECAS), Phase  
2. Volume 3: Summary and advanced steam plant  
with pressurized fluidized bed boilers  
[NASA-CN-134942-VOL-3]  
15 p0379 N77-26630

Technical and economic feasibility of solar  
augmentation for boiler feedwater heating in  
steam-electric power plants  
[COO-2864-1]  
16 p0555 N77-33626

## BOLIVIA

The 29950 Earth Resource Technology Satellite  
(ERTS-A) sensor data for mineral resource sector  
development and regional land use survey, March  
- August 1976 --- Bolivia  
[E77-10028]  
13 p0096 N77-11491

LANDSAT (ERTS) used as a basis for geological  
volcanological mapping in the central Andes  
[NASA-TN-75024]  
15 p0390 N77-27474

BORING MACHINES  
New turbodrill for geothermal drilling  
16 p0456 A77-48810

Thermocorer for geothermal applications  
16 p0456 A77-48811

BORON  
Conditions for a boron fusion reactor in the MeV  
range  
16 p0436 A77-47366

BOUNDARY LAYER CONTROL  
Energy and economic trade offs for advanced  
technology subsonic aircraft  
14 p0201 A77-29471

BOUNDARY LAYER FLOW  
Effect of nonuniform conductivity in the boundary  
layer at the electrode wall on local  
characteristics of an MHD generator with a  
diagonal electrode configuration and a subsonic  
stream  
13 p0001 A77-10423

Calculation of turbulent magnetohydrodynamic  
boundary layers in MHD generator channels  
13 p0046 A77-13242

The influence of lateral mass efflux on free  
convection boundary layers in a saturated porous  
medium  
[PB-261558/1]  
15 p0342 N77-22587

BOUNDARY LAYER SEPARATION  
Boundary-layer separation from the electrode wall  
of an MHD generator  
13 p0048 A77-13711

Diffuser augmentation of wind turbines  
[CONF-760842-6]  
16 p0521 N77-29610

BOUNDARY LAYER STABILITY  
Salt requirement and stability of solar ponds  
16 p0482 A77-49027

BOUNDARY LAYERS  
Study of the electrical characteristics of the  
boundary layer on the metal surfaces in the  
channels of an open cycle MHD generator  
13 p0054 A77-15666

BRAKES (FOR ARRESTING MOTION)  
Flywheel module for electric vehicle regenerative  
braking  
16 p0447 A77-48728

BRAKING  
Energy storage propulsion system for advanced  
concept train --- braking energy recovery  
14 p0200 A77-29467

The use of composite flywheels for braking energy  
recovery in road transport vehicles  
16 p0401 A77-41351

BRAYTON CYCLE  
A conceptual design study of closed Brayton cycle  
gas turbines for fusion power generation  
13 p0022 A77-12676

Multipurpose insulation system for a radioisotope  
fueled Mini-Brayton Heat Source Assembly  
13 p0022 A77-12678

10 MW solar thermal electric power plant design  
for solar day operation  
14 p0153 A77-21842

A modular fixed-mirror Brayton-cycle solar power  
system  
14 p0154 A77-21846

Gas-fired heat pumps - An emerging technology  
14 p0195 A77-27891

Closed Brayton cycle turbines for satellite solar  
power stations  
15 p0296 A77-35816

Conceptual design of closed Brayton cycle for  
coal-fired power generation  
16 p0445 A77-48714

Light commercial Brayton/Rankine space  
conditioning system  
16 p0445 A77-48716

Thermal scale modeling of the central receiver of  
a helium Brayton cycle solar powerplant  
16 p0445 A77-48717

# SUBJECT INDEX

# BUILDINGS

- Integration of high temperature thermal energy storage into a solar thermal Brayton cycle power plant  
16 p0461 A77-48842
- Closed Brayton cycle using hydrogen as a work fluid [BNL-20899]  
13 p0085 A77-10542
- Braxton isotope power system. Phase 1: (Ground demonstration system) Configuration Control Document (CCD) [TID-27252]  
15 p0380 A77-26644
- Comparative thermodynamic performance of some Rankine/Brayton cycle configurations for a low-temperature energy application  
16 p0532 A77-31207
- BRAZIL**  
Solar energy prospects for electric power generation in Brazil

Waste heat vs conventional systems for greenhouse environmental control: An economic assessment  
[ORNL-TM-5069] 13 p0088 N77-10656

CCMS solar energy pilot study solar heating and cooling systems in buildings  
[UND-4908-5] 13 p0088 N77-10657

Analysis of solar energy system for the GSA demonstration office building at Manchester, New Hampshire  
[PB-254179/5] 13 p0091 N77-10687

Commercial building unitary heat pump system with solar heating  
[PB-255488/9] 13 p0099 N77-11551

Definition study for photovoltaic residential prototype system  
[NASA-CR-135039] 13 p0113 N77-13532

Definition study for photovoltaic residential prototype system  
[NASA-CR-135056] 13 p0113 N77-13533

Interim feasibility assessment method for solar heating and cooling of Army buildings  
[AD-A026588] 13 p0124 N77-14606

The structure of building specifications  
[PB-257581/9] 13 p0132 N77-15524

Intermediate minimum property standards for solar heating and domestic hot water systems  
[PB-257086/9] 13 p0132 N77-15525

The design of a solar energy collection system to augment heating and cooling for a commercial office building  
[NASA-TM-X-72753] 14 p0207 N77-16446

Experimental polyurethane foam roofing systems  
[AD-A031046] 14 p0210 N77-17255

Solar heating retrofit of military family housing  
[AD-A030843] 14 p0226 N77-19659

Detecting structural heat losses with mobile infrared thermography. Part 4: Estimating quantitative heat loss at Dartmouth College, Hanover, New Hampshire  
[AD-A031803] 14 p0228 N77-20393

NASA Technology Utilization House technical support package  
[NASA-TM-X-74686] 15 p0358 N77-24011

Baseline performance of solar collectors for NASA Langley solar building test facility  
[NASA-TM-X-3505] 15 p0363 N77-24587

Design of municipal services in support of high rise office buildings  
[PB-262532/5] 15 p0370 N77-25021

General Electric Company survey to define impact of statewide building codes on solar HVAC systems, commercial buildings. National Solar Demonstration Program  
[COO-2683-76-11] 15 p0383 N77-26674

National program for solar heating and cooling of buildings  
[ERDA-76-6] 16 p0515 N77-28604

Energy utilization index method for predicting building energy use. Volume 2: Proposed supplement to TB ENG 529  
[AD-A040344] 16 p0521 N77-29608

Demonstration of building heating with a heat pump using thermal effluent  
[AD-A041024] 16 p0530 N77-30631

Comparison of computer-predicted and observed energy uses in a multi-family high-rise apartment building  
[PB-267829/0] 16 p0539 N77-31665

Market evaluation study: Solar heating and domestic hot water heating in DoD buildings  
[AD-A042178] 16 p0546 N77-32597

**BURNERS**

Firing systems for combustion of natural gas, crude oil and bunker C-oil - Selection of parameters for thermal power station units and the applied systems of steam generation  
16 p0439 A77-48092

Burner design criteria for control of NOx from natural gas combustion. Volume 2: Raw data and experimental results  
[PB-256806/1] 13 p0115 N77-13549

**BURNING RATE**

Combustion of oil-shale carbon residue  
14 p0193 A77-27343

**BURNING TIME**

Combustion of oil-shale carbon residue  
14 p0193 A77-27343

**BURNOUT**

Burnout of gaseous fuel in a tube combustion chamber with longitudinally distributed air supply  
15 p0272 A77-33170

**BUTANES**

Sensitivity analysis for OTFC propane and mixture cycles --- Ocean Thermal Energy Conversion  
16 p0485 A77-49047

Petroleum market shares. Report on sales of propane to ultimate consumers, 1975  
[PB-255624/9] 13 p0108 N77-12540

Conceptual design of a 10MW regenerative isobutane geothermal power plant  
[PB-261563/1] 15 p0349 N77-22683

**C****CADASTRAL MAPPING**

Experience in constructing a solar energy cadastral survey  
16 p0443 A77-48525

**CADMIUM ANTIMONIDES**

Theoretical and experimental validation of new sources of electrical energy  
14 p0176 A77-24457

**CADMIUM COMPOUNDS**

Evaluation of cadmium stannate films for solar heat collectors  
14 p0198 A77-29021

Laboratory investigations on thermochemical hydrogen production  
15 p0276 A77-33348

Cadmium stannate selective optical films for solar energy applications  
[PB-261850/2] 15 p0348 N77-22672

**CADMIUM SELENIDES**

Evaluation of CdS photovoltaic cells in the framework of the development of solar electric power plants  
14 p0149 A77-21796

Photovoltaic properties of thin-film Cu<sub>2</sub>S-CdS heterojunctions  
14 p0149 A77-21801

Photoelectrochemical energy conversion and storage - The polycrystalline CdSe cell with different storage modes  
14 p0196 A77-28463

Semiconductor-electrolyte photovoltaic cells employing CdSe and CdTe  
15 p0259 A77-30742

Spectral response and efficiency relations in semiconductor liquid junction solar cells  
15 p0264 A77-31823

Solar conversion efficiency of pressure sintered cadmium selenide liquid junction cells  
15 p0320 A77-38367

**CADMIUM SULFIDES**

CdS-Cu<sub>2</sub>S solar cells fabricated on Cd<sub>2</sub>SnO<sub>4</sub>-silica substrates  
13 p0007 A77-11110

Preparation and characteristics of CuGaSe<sub>2</sub>/CdS solar cells  
13 p0069 A77-18517

Recent progress in low cost CdS-Cu<sub>2</sub>S solar cells  
14 p0147 A77-21781

Theoretical prospects of the CdS-Cu<sub>2</sub>S solar cell  
14 p0149 A77-21797

Technology of large area Cu<sub>x</sub>/S-CdS solar cells  
14 p0149 A77-21798

Investigation on the crystalline structure of Cu<sub>x</sub>/S-CdS solar cells  
14 p0149 A77-21803

High efficiency n-CdS/p-InP solar cells prepared by the close-spaced technique  
14 p0156 A77-22081

Photovoltaic properties of n-CdS/p-CdTe heterojunctions prepared by spray pyrolysis  
14 p0198 A77-29023

Preparation of CdS/InP solar cells by chemical vapor deposition of CdS  
14 p0205 A77-29893

Design analysis of the thin-film CdS-Cu<sub>2</sub>S solar cell  
15 p0258 A77-30721

InP-CdS solar cells  
15 p0259 A77-30740

Development of the fluidized-bed carbon-burnup cell 16 p0454 A77-48789  
Simplex optimization of carbon electrodes for the hydrogen oxygen membrane fuel cell 16 p0500 A77-50200  
Concurrent carbon gasification and carbon deposition in chars 16 p0508 A77-51590  
The relation between isotopic composition of argon and carbon in natural gases 16 p0531 N77-30680  
[NASA-TN-75134]

**CARBON COMPOUNDS**  
Electric current from the direct conversion of low molecular weight C,H,O-compounds 13 p0055 A77-15814

**CARBON DIOXIDE**  
Air, water, nuclear power make gasoline 13 p0045 A77-12935  
Effects of anthropogenic emissions on climate - A review of selected topics 13 p0067 A77-18295  
Atmospheric carbon dioxide variations at the South Pole 13 p0067 A77-18439  
Theoretical work on reaction sequences in the gasification of coke by carbon dioxide and by steam in conditions remote from equilibrium 14 p0198 A77-28776  
A petroleum substitute - Active CO<sub>2</sub> 14 p0200 A77-29325  
Synthetic carbonaceous fuel and feedstock using nuclear power, air and water 15 p0321 A77-38532  
Can we control the carbon dioxide in the atmosphere 15 p0322 A77-38674  
Synthetic carbonaceous fuels and feedstocks from oxides of carbon and nuclear power 16 p0444 A77-48711  
Reactivity of oil shale carbonaceous residue with oxygen and carbon dioxide [UCRL-77829] 13 p0123 N77-14596

**CARBON DIOXIDE LASERS**  
Some results of MHD-laser investigation 15 p0328 A77-39549  
Use of a carbon dioxide laser in remote detection of petroleum oil pollution at sea 16 p0433 A77-47080

**CARBON ISOTOPES**  
Isotopic characterization of Illinois natural gas 13 p0113 N77-13484

**CARBON MONOXIDE**  
COSTEAM: Low-rank coal liquefaction - An updated analysis 13 p0045 A77-12934  
Catalytic coal liquefaction using synthesis gas 13 p0059 A77-16473  
Molecular synthesis in the case of the Fischer-Tropsch synthesis - Reaction steps of the molecular synthesis by means of the catalytic transformation of carbon monoxide and hydrogen 15 p0268 A77-32248  
Synthetic carbonaceous fuels and feedstocks from oxides of carbon and nuclear power 16 p0444 A77-48711  
Development of fuel cell CO detection instruments for use in a mine atmosphere [PB-254823/8] 13 p0095 N77-11380

**CARBON STEELS**  
Metallurgical analysis of a plain carbon-steel plate after long-term service in a coal gasifier [PB-268106/2] 16 p0543 N77-32295

**CARBON 14**  
Cooperative geochemical resource assessment of the Mesa Geothermal system [PB-257225/3] 13 p0132 N77-15520

**CARBON-CARBON COMPOSITES**

Experimental screening of carbon-base materials for impact members in isotopic heat sources [BNI-X-673] 15 p0396 N77-27901

**CARBONATES**

Evaporation of solution droplets in a high-temperature medium --- potassium carbonate MHD flow properties 13 p0046 A77-13254

Evaporation of a drop of solution in a high-temperature medium --- potassium carbonate MHD flow properties 15 p0263 A77-31534

Molten carbonate fuel cell model 16 p0447 A77-48737

Reactivity of oil shale carbonaceous residue with oxygen and carbon dioxide [UCRL-77829] 13 p0123 N77-14596

**CARBONIZATION**

Coal gasification --- by destructive distillation and coke residue gasification processes 15 p0262 A77-31471

**CARBURIZING**

Laboratory investigation of high temperature alloy failure mechanisms 15 p0271 A77-32608

**CARGO**

North American freight transportation - Near or incipient chaos 16 p0410 A77-41943

**CARGO AIRCRAFT**

Application of advanced technology to future long-range aircraft [SAWE PAPER 1126] 13 p0016 A77-12194

Design of a large span-distributed load flying-wing cargo airplane [NASA-TN-X-74031] 15 p0353 N77-23089

An evaluation of very large airplanes and alternative fuels [AD-A040532] 16 p0532 N77-31334

**CARNOT CYCLE**

Thermodynamic constraints, effective temperatures and solar cells 14 p0147 A77-21779

Problems relating to heat storage --- at solar thermal power plant 14 p0152 A77-21826

Miniature solar-electric power system 16 p0462 A77-48848

**CASCADE FLOW**

A precise satellite thermal control system using cascaded heat pipes [AIAA PAPER 77-777] 15 p0312 A77-31282

**CASSEGRAIN OPTICS**

A Cassegrain system for solar radiation 13 p0063 A77-17561

Paraboloid-hyperboloid concentrating systems and their accuracy 15 p0286 A77-33433

Paraboloid-hyperboloid concentrating systems and their accuracy 16 p0427 A77-45546

**CATALYSIS**

Catalytic coal gasification for SNG production --- Synthetic Natural Gas 13 p0022 A77-12683

Catalytic coal liquefaction using synthesis gas 13 p0059 A77-16473

A petroleum substitute - Active CO<sub>2</sub> 14 p0200 A77-29325

Molecular synthesis in the case of the Fischer-Tropsch synthesis - Reaction steps of the molecular synthesis by means of the catalytic transformation of carbon monoxide and hydrogen 15 p0268 A77-32248

The oxidant formation potential of emissions from catalyst-equipped vehicles 15 p0333 A77-39596

Catalytic action of combustion-product deposits in the oxidation of SO<sub>2</sub> to SO<sub>3</sub> within the combustion chambers and exhaust channels of thermoelectric plants 16 p0420 A77-44179

The electron factor in catalysis on metals electrocatalysis on non-metallic surfaces [PB-256264/3] 13 p0103 N77-12166

## CATALYSTS

- Titanium-containing Raney nickel catalyst for hydrogen electrodes in alkaline fuel cell systems 13 p0064 A77-18019
- Anodic oxidation of ethylene glycol with noble metal alloy catalysts --- in fuel cell 15 p0260 A77-31171
- Emissions and performance of catalysts for gas turbine catalytic combustors [NASA-TN-X-73543] 13 p0104 N77-12406
- Optimization of Pt-doped Kocite (trademark) electrodes in H<sub>2</sub> PO<sub>4</sub> fuel cells [AD-A025326] 13 p0107 N77-12529
- Manufacturing and evaluation of phthalocyanines as catalysts for fuel cells [BMPT-PB-T-76-25] 13 p0114 N77-13540
- Catalytic synthesis of gaseous hydrocarbons [FE-1814-2] 13 p0130 N77-15503
- Surface research for development of new electrocatalysts for acid electrolyte fuel cells [AD-A026053] 13 p0131 N77-15517
- XRF analysis of some regenerated catalysts [MRL-TN-388] 15 p0376 N77-26247
- Durability testing at one atmosphere of advanced catalysts and catalyst supports for automotive gas turbine engine combustors, part 1 [NASA-CR-135132] 16 p0520 N77-29519
- CATALYTIC ACTIVITY**
- Catalytic hydrogenation of solvent-refined lignite to liquid fuels 13 p0008 A77-11243
- Highly dispersed tungsten carbide for fuel cells with an acidic electrolyte 13 p0055 A77-15815
- Batch autoclave studies of catalytic hydrodesulfurization of coal 14 p0145 A77-21617
- Hydrocarbon cracking developments in the DDR 14 p0164 A77-23098
- Kinetics of heterogeneously catalyzed coal hydroliquefaction 14 p0196 A77-28473
- Influence of bonding and filling agents on the activity of tungsten carbide hydrogen electrodes 15 p0260 A77-31173
- A consideration of catalytic effects on Pt-Pt/Rh thermocouples in combustion systems involving hydrogen as a fuel 15 p0283 A77-33407
- Automotive sulfate emissions 15 p0290 A77-34629
- Fundamentals of coal liquefaction 15 p0309 A77-36814
- A consideration of catalytic effects on Pt-Pt/Rh thermocouples in combustion systems involving hydrogen as a fuel 14 p0245 N77-21645

## CATHODES

- Study of cathode spots in the presence of slag films on the electrodes of an open-cycle MHD generator 13 p0053 A77-15005
- Cathode spots on metallic electrodes of an MHD-channel 15 p0269 A77-32518

## CAVITIES

- Comprehensive ground control study of a mechanized longwall operation. Volume 2: Special reports. 1: Physical properties of coal and coal measure rocks. 2: Bearing capacity of roof and floor rocks. 3: Response of borehole pressure cells. 4: Installation of subsurface instrumentation [PB-262476/5] 15 p0368 N77-24711

## CELL ANODES

- Anodic oxidation of ethylene glycol with noble metal alloy catalysts --- in fuel cell 15 p0260 A77-31171
- Influence of bonding and filling agents on the activity of tungsten carbide hydrogen electrodes 15 p0260 A77-31173
- Hydrogen and electricity from water and light 16 p0430 A77-46609
- N-CdS/n-GaAs voltage-enhanced photoanode --- in photoelectrochemical solar cell 16 p0503 A77-50287
- Electrically rechargeable REDOX flow cell [NASA-CASE-LEW-12220-1] 13 p0121 N77-14581

## CELL CATHODES

- Improved negative electrodes for lithium/iron sulfide batteries 16 p0448 A77-48742

## CELLS (BIOLOGY)

- The palirrhrotrophic origin of energy metabolism --- chemiosmotic precursor to phototropism in estuarine cellular organisms 13 p0064 A77-17895

## CELLULOSE

- Enzymatic hydrolysis of cellulosic wastes to fermentable sugars for alcohol production 15 p0315 A77-37666

## CEMENTS

- Environmental considerations of selected energy conserving manufacturing process options. Volume 10: Cement industry report [PB-264276/7] 15 p0384 N77-26687

## CENTRAL ATLANTIC REGION (US)

- Identification and analysis of mid-Atlantic onshore OCS impact [PB-254925/1] 13 p0096 N77-11516

## CENTRIFUGAL COMPRESSORS

- Improvements in fluid machines and systems for energy conversion. Volume 4 --- Book 15 p0309 A77-36815

## CENTRIFUGAL PUMPS

- The use of solar cells as energy supply for a pumping system 14 p0155 A77-21854
- Improvements in fluid machines and systems for energy conversion. Volume 4 --- Book 15 p0309 A77-36815

## CERAMIC COATINGS

- Selective black absorbers using RF-sputtered Cr<sub>2</sub>O<sub>3</sub>/Cr cermet films 15 p0265 A77-31951
- Effect of ceramic coating of JT8D combustor liner on maximum liner temperatures and other combustor performance parameters [NASA-TN-X-73581] 13 p0126 N77-15037
- Ceramic heat pipe heat exchangers [LA-6514-MS] 15 p0361 N77-24431

## CERAMICS

- High-temperature ceramics for automobile gas turbines. II 13 p0063 A77-17591
- Ceramic thin film CdTe solar cell 14 p0135 A77-19635
- Progress on the testing of refractories for directly-fired MHD air heater service 14 p0142 A77-21254
- Calculation of thermal stresses in ceramic elements of the refractory channel walls of a magnetohydrodynamic generator 15 p0263 A77-31540
- Corrosion of potential MHD preheater materials in liquid slag and slag-seed 15 p0327 A77-39541
- Generator wall slag coating and material corrosion experiments 15 p0327 A77-39542
- Design and performance of high temperature ceramic electrode modules --- in MHD generators 15 p0327 A77-39543
- Progress on the testing of refractories for directly-fired MHD air heater service. II 15 p0328 A77-39544
- Ceramic materials and components for small automotive gas turbine engine [AD-A025472] 13 p0095 N77-11417
- Analysis of ceramic materials for impact members in isotopic heat sources [BNI-X-670] 14 p0210 N77-17246
- Ceramic applications in the advanced Stirling automotive engine [NASA-TN-X-73632] 15 p0354 N77-23487
- Ceramics for the advanced automotive gas turbine engine: A look at a single shaft design [NASA-TN-X-73651] 15 p0354 N77-23490
- Basic research on ceramic materials for energy storage and conversion systems [COO-2564-2] 16 p0511 N77-28305
- Ceramic coatings for components exposed to coal-gas environments: A review [ANI-76-124] 16 p0532 N77-31323
- Study and program plan for improved heavy duty gas turbine engine ceramic component development [NASA-CR-135230] 16 p0542 N77-32033

## CERMENTS

- Applications of thin graded-index films to solar absorbers 15 p0260 A77-31244
- Selective black absorbers using RF-sputtered Cr2O3/Cr cermet films 15 p0265 A77-31951

## CESIUM

- Results of closed cycle MHD power generation test with a helium-cesium working fluid [NASA-TN-X-73621] 15 p0357 N77-23936

## CESIUM DIODES

- Anomalous current-voltage characteristics observed during reactor tests of multielement thermionic assemblies 13 p0018 A77-12361

## CESIUM PLASMA

- Estimates of optimal generating conditions for hydrogen-oxygen cesium-seeded magneto-hydrodynamic power generator [NASA-TN-D-8374] 14 p0213 N77-17852

## CETANE

- An experimental study supported by a computer simulation in a prechamber CFR diesel engine leading to a modified cetane scale for rating low ignition quality fuels 16 p0525 N77-30259

## CHALCOGENIDES

- Thermoelectric power of pseudoternary solid solutions 13 p0014 A77-11917

## CHANNEL FLOW

- Calculation of turbulent magnetohydrodynamic boundary layers in MHD generator channels 13 p0046 A77-13242
- Acoustic properties of subsonic MHD channel 13 p0054 A77-15668
- In-channel observations on coal slag --- in MHD generators 14 p0139 A77-21222
- Progress on the Mark VI long-duration MHD generator 14 p0141 A77-21237
- Consideration of three-dimensional effects in MHD power generators 14 p0142 A77-21261
- Cathode spots on metallic electrodes of an MHD-channel 15 p0269 A77-32518
- Influence of flow nonuniformity on plasma instability at the channel wall 15 p0269 A77-32520
- Investigation of two-dimensional electric effects in a sectional MHD-channel 15 p0317 A77-37930
- Gaseous electrode development at RMC --- for plasma channel operation in MHD generators 15 p0325 A77-39530
- Design, construction, and testing of a compact, lightweight combustion driven MHD generator channel and diffuser 15 p0326 A77-39532
- Molecular gas performance of a disk generator with swirl 15 p0326 A77-39534
- The influence of the transverse current nonuniformity, caused by current leakages onto the insulating walls of the channel, on the local characteristics of a nonideal MHD generator 15 p0329 A77-39553
- Three dimensional current distribution in diagonal conducting wall channels 15 p0329 A77-39556
- Coupled electrical and fluid calculations in the cross plane in linear MHD generators 15 p0329 A77-39557
- A consideration of some three-dimensional effects in MHD channel 15 p0330 A77-39560
- Subsonic MHD-diffuser performance with high blockage 15 p0331 A77-39567
- Progress in channel development for direct coal fired MHD 16 p0458 A77-48824

## CHARCOAL

- Coal gasification update 15 p0306 A77-36763
- Multi-stage activation of brown-coal chars with oxygen 16 p0401 A77-41319

## CHARGE CARRIERS

- Fundamental electronic mechanisms limiting the performance of solar cells 15 p0257 A77-30710
- Efficiency calculations for Al/x/Ga/1-x/As-GaAs heteroface solar cells 15 p0257 A77-30720

## CHARGED PARTICLES

- Charge characteristics of particles in coal derived liquids - Measurement and origin 16 p0412 A77-42408

## CHEMICAL ANALYSIS

- Characterization of synthetic liquid fuels --- analytical separation and spectroscopic techniques 14 p0169 A77-23554
- Definition and analysis of thermochemical processes for hydrogen production based on iron-chlorine reactions 15 p0276 A77-33351
- MHD combustor effluent chemistry measurements using Raman scattering 16 p0425 A77-44825
- The origin of the oil sand bitumens of Alberta - A chemical and a microbiological simulation study 16 p0438 A77-47765
- Theoretical, numerical, and physical techniques for characterizing power plant plumes [PB-253099/6] 13 p0101 N77-11599
- Fuel contaminants. Volume 1: Chemistry [PB-256020/9] 13 p0103 N77-12231
- Environmental assessment sampling and analytical strategy program --- industrial wastes [PB-261259/6] 15 p0352 N77-23021
- Approaches to chemical class analyses of fossil derived materials [CONF-770301-5] 16 p0532 N77-31271
- Chemical characterization of diesel exhaust particulates [PERC/RI-77/5] 16 p0540 N77-31671
- Large scale scientific computation via minicomputer [PB-267575/9] 16 p0541 N77-31823

## CHEMICAL CLEANING

- Chemical cleaning of coal [ASME PAPER 76-WA/APC-2] 14 p0184 A77-26409

## CHEMICAL COMPOSITION

- Organization of long range transport of air pollution monitoring in Europe 13 p0071 A77-18754
- Composition and size distribution of in-stack particulate material at a coal-fired power plant 14 p0139 A77-21018
- Batch autoclave studies of catalytic hydrosulfurization of coal 14 p0145 A77-21617
- Details of hydrogen-burning thermonuclear reactions 14 p0168 A77-23457
- Development of the modified in situ oil-shale process 14 p0193 A77-27342

## CHEMICAL COMPOUNDS

- Enhanced energy utilization from a controlled thermonuclear fusion reactor [PB-260653/1] 14 p0234 A77-20879

## CHEMICAL EFFECTS

- Desulfurization of coal by use of chemical comminution 16 p0418 A77-43009

## CHEMICAL ENERGY

- Photoassisted electrolysis of water - Conversion of optical to chemical energy 13 p0021 A77-12666
- Thermochemical energy storage systems 13 p0028 A77-12738
- Operational chemical storage cycles for utilization of solar energy to produce heat or electric power 14 p0158 A77-22646
- Exergy considerations related to the acquisition, supply, and utilization of solar energy 14 p0203 A77-29572
- Petrochemical basic products from coal - Production of basic and intermediate products for the chemical industry according to the Fischer-Tropsch process 15 p0267 A77-32247
- Effective conversion processes between thermal and chemical energies - Thermodynamic study of multistep water decomposition processes 15 p0275 A77-33344

# SUBJECT INDEX

# CHEMILUMINESCENCE

Thermodynamic analysis of alternate energy carriers, hydrogen and chemical heat pipes  
15 p0279 A77-33374

Ocean thermal energy delivery systems based on chemical energy carriers  
15 p0279 A77-33375

ERDA's Chemical Energy Storage Program  
16 p0450 A77-48763

Evaluation of a chemical heat storage system for a solar steam power plant  
16 p0460 A77-48840

Application of chemical engineering to large scale solar energy  
16 p0491 A77-49098

Chemical methods of storing thermal energy  
16 p0491 A77-49100

Production of chemical energy carriers by non-expandable energy sources --- solar energy electrolysis, photolysis, and thermochemical cycles  
[DLR-PB-76-32] 13 p0114 A77-13541

Study of the application of solar chemical dehumidification system to wind tunnel facilities of NASA Lewis Research Center at Cleveland, Ohio  
[NASA-CR-149886] 14 p0227 A77-20116

Ocean thermal energy delivery systems based on chemical energy carriers  
14 p0240 A77-21609

Production of chemical energy carriers by non-expandable energy sources --- solar energy electrolysis, photolysis, and thermochemical cycles  
[ESA-TT-338] 14 p0251 A77-21701

**CHEMICAL ENGINEERING**

Design analyses of a methane-based chemical heat pipe  
13 p0028 A77-12737

On the production of town gas from off-gases of the chemical processing industry  
14 p0164 A77-23099

Coal gasification --- by destructive distillation and coke residue gasification processes  
15 p0262 A77-31471

Methanol, past, present, and speculation on the future --- manufacture techniques and fuel applications  
15 p0289 A77-34114

Energy use patterns in metallurgical and nonmetallurgical mineral processing (Volume 1, Phase 9: Areas where alternative technologies should be developed to lower energy use in production of high-priority commodities), supplement  
[PB-261153/1] 15 p0346 A77-22645

Chemical engineering side of nuclear fusion power  
[PPPL-1303] 15 p0376 A77-25965

Development of high stability fuel. Executive summary  
[AD-A039977] 16 p0533 A77-31339

**CHEMICAL EVOLUTION**

Chemical evolution of photosynthesis  
13 p0071 A77-18898

**CHEMICAL EXPLOSIONS**

Thermal explosion of moving reacting fluids of variable viscosity  
13 p0052 A77-14980

**CHEMICAL FRACTIONATION**

Hydrocarbon cracking developments in the DDR  
14 p0164 A77-23098

Fracturing oil shale with explosives for in situ recovery  
14 p0169 A77-23559

Coal particle integrity in high-temperature solvents, with and without agitation  
16 p0401 A77-41317

**CHEMICAL FUELS**

Shale oil, tar sands, and related fuel sources --- Book  
14 p0169 A77-23551

Fuels via bioconversion  
14 p0176 A77-24569

Petrochemical basic products from coal - Production of basic and intermediate products for the chemical industry according to the Fischer-Tropsch process  
15 p0267 A77-32247

**CHEMICAL PROPERTIES**

The influence of the properties of coals on their conversion into clean fuels  
13 p0009 A77-11245

Some properties of coal slags of importance to MHD  
15 p0330 A77-39563

Antiwear additives, wear studies on chemical addition agents for imparting an effective lubricating response in polysiloxane (silicone) fluids  
[AD-A033527] 15 p0340 A77-22270

**CHEMICAL PROPULSION**

Near-term chemically-propelled space transport systems --- to space colonies  
15 p0295 A77-35810

**CHEMICAL REACTION CONTROL**

Balance and optimization procedure for thermochemical cycles for hydrogen production  
15 p0276 A77-33345

**CHEMICAL REACTIONS**

Study of the ionization of the additive in MHD installations  
13 p0002 A77-10424

Thermochemical energy storage systems  
13 p0028 A77-12738

Energy storage via calcium hydride production  
13 p0032 A77-12774

Hydrogen production from water by means of chemical cycles  
13 p0058 A77-16471

Progress in the Los Alamos Scientific Laboratory Program to develop thermochemical processes for hydrogen production  
15 p0275 A77-33341

Discovery of reaction sequences for thermochemical water splitting --- in hydrogen production cycles  
15 p0275 A77-33343

Mathematical method for determining reaction networks in chemical systems  
16 p0418 A77-43093

Energy corradation using the reversible ammonia reaction --- for solar power generation  
16 p0422 A77-44483

Chemical methods of storing thermal energy  
16 p0491 A77-49100

Preliminary study of the importance of hydrothermal reactions on the temperature history of a hot, dry rock geothermal reservoir  
[PB-262391/6] 14 p0252 A77-21731

Geothermal chemistry activities at LASL  
[LA-6448-PR] 15 p0344 A77-22623

**CHEMICAL REACTORS**

Hydrogen production by the steam-iron process  
13 p0023 A77-12688

Operation of the Westinghouse Coal Gasification Process Development Unit  
13 p0023 A77-12689

A combined cycle with a partial-oxidation reactor  
13 p0062 A77-17534

Upgrading coal liquids to gas turbine fuels. III - Exploratory process studies  
14 p0178 A77-24853

The concept of 'nuclear hydrogen production' and progress of work in the Nuclear Research Center Juelich  
15 p0273 A77-33328

Flash hydrolysis process for conversion of lignite to liquid and gaseous products  
15 p0301 A77-36334

Advanced gasification technologies  
15 p0308 A77-36811

Gasification and generation of electricity --- coal utilization  
15 p0308 A77-36812

Producer gas from agricultural wastes - Its production and utilization in a converted oil-fired boiler  
15 p0323 A77-39106

Development of the Westinghouse coal gasification process - A status report  
16 p0446 A77-48722

Catalytic synthesis of gaseous hydrocarbons  
[FE-1814-2] 13 p0130 A77-15503

**CHEMILUMINESCENCE**

Some considerations in determining oxides of nitrogen in stack gases by chemiluminescence analyzer  
13 p0062 A77-17541

## CHILE

LANDSAT (ERTS) used as a basis for geological  
volcanological mapping in the central Andes  
[NASA-TM-75024] 15 p0390 N77-27474

## CHINESE PEOPLES REPUBLIC

China claims lead in biogas energy supply  
15 p0297 A77-36050

## CHLORIDES

Aerosol formation during coal combustion -  
Condensation of sulfates and chlorides on flyash  
13 p0054 A77-15778

Engineering design and cost analysis of chlorine  
storage concepts for a zinc-chlorine  
load-leveling battery  
[PB-262016/9] 14 p0252 N77-21727

## CHLORINE

A hydrogen-halogen energy storage system for  
electric utility applications 16 p0457 A77-48818

Evaluation of a 1 kWh zinc chloride battery system  
[PB-260683/8] 14 p0236 N77-21356

Feasibility studies of chemical reactions for  
thermochemical water splitting cycles of the  
iron-chlorine-, iron-sulfur- and  
manganese-sulfur families 14 p0238 N77-21572

Environmental considerations of selected energy  
conserving manufacturing process options.  
Volume 12: Chlor-alkali industry report  
[PB-264278/3] 15 p0385 N77-26689

## CHLOROPLASTS

Biological solar energy conversion: Approaches to  
overcome yield, stability and product limitations  
[PB-261910/4] 15 p0350 N77-22688

Biological solar energy conversion: Approaches to  
overcome yield, stability and product limitations  
[PB-267937/1] 16 p0554 N77-33619

## CHROMATOGRAPHY

Chromatographic determination of adsorption and  
diffusion in a bidispersed porous solid  
[LBL-5273] 16 p0532 N77-31269

## CHROMIUM

A new Chrome Black selective absorbing surface ---  
for solar radiation 16 p0406 A77-41585

Fundamental studies of black chrome for solar  
collector use 16 p0498 A77-49160

## CHROMIUM ALLOYS

Metal dusting corrosion in coal gasification  
environments 15 p0337 A77-40042

## CHROMIUM OXIDES

Selective black absorbers using RF-sputtered  
Cr2O3/Cr cermet films 15 p0265 A77-31951

The optical properties of chromium oxide films and  
the high temperature stabilization of silver  
films for photothermal solar energy conversion  
13 p0128 N77-15484

## CIRCUIT RELIABILITY

Cooling arrays of circuit cards using heat pipes  
and forced air diffusers 13 p0031 A77-12766

Research and development of cryoalternators for  
large-electrical power systems 14 p0190 A77-26536

## CISLUNAR SPACE

Environmental impact of space manufacturing  
[AIAA PAPER 77-539] 15 p0266 A77-32062

## CITIES

Evolution of atmospheric pollution /high acidity  
and black fumes/ in France during 1975  
13 p0002 A77-10670

Assessing the relationship between urban form and  
travel requirements: A literature review and  
conceptual framework  
[PB-254588/9] 13 p0102 N77-11923

Improved engineering-economic model of residential  
energy use  
[ORNL-COM-8] 16 p0557 N77-33644

## CIVIL AVIATION

Our amazing air transportation system /AIAA-SAE  
William Littlewood Memorial Lecture/ --- civil  
aviation aircraft historical overview  
[AIAA PAPER 77-356] 13 p0067 A77-18260

The seat belt light is on --- airline industry  
economic assessment and forecasts 13 p0080 A77-19175

The competitive market for commercial VSTOL  
[AIAA 77-573] 15 p0290 A77-34933

Energy utilization factor in civil transport  
aircraft 15 p0307 A77-36788

A view of the future - Constraints and opportunities  
--- aviation effects on world structure  
16 p0410 A77-41944

Future aircraft requirements: A notebook of  
airline thoughts 13 p0117 N77-13976

Air transport propulsion for the 1980's  
13 p0117 N77-13980

Aviation economics --- commercial airlines  
[GPO-73-830] 15 p0352 N77-23008

## CLASSIFICATIONS

Classification of oils by the application of  
pattern recognition techniques to infrared spectra  
[AD-A039387] 16 p0531 N77-30841

## CLEAN ENERGY

Low-sulfur coal obtained by chemical  
desulfurization followed by liquefaction  
13 p0008 A77-11242

Evaluation of coal liquefaction efficiency based  
on various ranks 13 p0009 A77-11244

The influence of the properties of coals on their  
conversion into clean fuels 13 p0009 A77-11245

Solids gasification for gas turbine fuel 100 and  
300 Btu gas 13 p0022 A77-12685

Low-Btu gasification of coal by Atomics  
International's molten salt process 13 p0023 A77-12687

Wind energy for human needs 14 p0145 A77-21400

Direct and indirect economics of wind energy  
systems relative to fuel based systems 14 p0165 A77-23358

Balancing power supply from wind energy converting  
systems 14 p0166 A77-23361

Clean fuels from biomass 14 p0167 A77-23390

Fuel cells - A sleeper in the energy race  
14 p0170 A77-23647

Why solar energy --- advantages over fossil fuel  
and nuclear energy 14 p0170 A77-23654

Energy from the wind 14 p0179 A77-25575

Coal gasifier projects gather momentum  
14 p0184 A77-26290

Underground gasification offers clean safe route  
to coal energy 14 p0184 A77-26292

Applicability of the Meyers Process for  
desulfurization of U.S. coal /A survey of 35  
coal mines/ 14 p0191 A77-27278

SO2 control technologies - Commercial  
availabilities and economics 14 p0191 A77-27279

A new concept for the manufacture of low sulfur  
fuels and chemicals from coal 14 p0192 A77-27295

Prospects for pipeline delivery of hydrogen as a  
fuel and as a chemical feedstock 14 p0200 A77-29437

Hydrogen energy - Its potential promises and  
problems 15 p0284 A77-33410

Clean energy from Alaskan coals 15 p0301 A77-36333

The IGT low-Btu gas process - Design and economics  
--- clean fuel gas from coal 15 p0301 A77-36335

Winkler technology for clean fuels from coal  
15 p0301 A77-36337

Preliminary economic analysis - Oil and power by  
COED-based coal conversion 15 p0301 A77-36338

Clean fuels from biomass, sewage, urban refuse,  
agricultural wastes; Proceedings of the  
Symposium, Orlando, Fla., January 27-30, 1976  
15 p0313 A77-37652

H<sub>2</sub>-O<sub>2</sub> combustion reactions 14 p0245 N77-21644

## COMBUSTION TEMPERATURE

Boundary layer measurements of temperature and electron number density profiles in a combustion MHD generator

15 p0288 A77-33710

## COMMERCE

Weekly petroleum statistics reports, 1974-1975 [PB-255920/1]

13 p0124 A77-14608

Energy management guide for light industry and commerce. EPIC energy management series [PB-263121/6]

15 p0356 A77-23616

Quarterly report to US House and Senate Committees on Appropriations (3rd) [PB-265490/3]

16 p0517 A77-28616

## COMMERCIAL AIRCRAFT

Liquid hydrogen as propellant for commercial aircraft

13 p0059 A77-16534

[DGLR PAPER 76-188] The pay-off for advanced technology in commercial aircraft design and operation

13 p0071 A77-19012

Air transport propulsion for the 1980's

14 p0138 A77-20717

Fuel subsystem characteristics for LH2 aircraft

15 p0281 A77-33393

The competitive market for commercial VSTOL [AIAA 77-573]

15 p0290 A77-34933

Cost/benefit assessment of the application of composite materials to subsonic commercial transport engines [NASA-TM-X-73557]

13 p0111 A77-13064

Future aircraft requirements: A notebook of airline thoughts

13 p0117 A77-13976

Air transport propulsion for the 1980's

13 p0117 A77-13980

Study of the cost/benefit tradeoffs for reducing the energy consumption of the commercial air transportation system [NASA-CR-137926]

13 p0126 A77-15007

Study of the cost/benefit tradeoffs for reducing the energy consumption of the commercial air transportation system [NASA-CR-137927]

13 p0126 A77-15008

Variable cycle engine applications and constraints --- for commercial and military (fighter) aircraft

15 p0339 A77-22125

Cost/benefit tradeoffs for reducing the energy consumption of the commercial air transportation system. Volume 1: Technical analysis [NASA-CR-137923]

15 p0353 A77-23072

Cost/benefit tradeoffs for reducing the energy consumption of the commercial air transportation system. Volume 2: Market and economic analyses [NASA-CR-137924]

15 p0353 A77-23073

Innovative Aircraft Design Study (IADS) task 2, volume 1 [AD-A041234]

16 p0531 A77-31141

## COMMERCIAL ENERGY

Space heating systems new and conventional in the Northwest with emphasis on alternate energy adaptations

13 p0028 A77-12736

Geothermal energy in Hawaii - Hydrothermal systems

13 p0029 A77-12741

Electric utility companies and geothermal power

13 p0031 A77-12759

Combined solar and petroleum energy HVAC system for a commercial building in Dhabran --- Heating, Ventilating and Air Conditioning

13 p0078 A77-19111

Water pumping - A practical application of solar energy

13 p0079 A77-19117

ECAS MHD system studies --- Energy Conversion Alternatives Study

14 p0142 A77-21268

The use of commercially available absorption units on solar-powered cooling systems

14 p0168 A77-23445

Thermal simulation of a building with solar assisted closed liquid loop unitary heat pumps [ASME PAPER 76-WA/SOL-23]

14 p0190 A77-26528

SO2 control technologies - Commercial availabilities and economics

14 p0191 A77-27279

The SRC-II process --- fuel oil and hydrogen production by Solvent Refined Coal technique

14 p0192 A77-27292

Considerations on coal gasification

15 p0266 A77-32169

Technical prospects for commercial and residential distribution and utilization of hydrogen

15 p0283 A77-33404

A comparison of residential and commercial energy use in the United States and Sweden

15 p0297 A77-36114

Historical patterns of residential and commercial energy uses

15 p0298 A77-36244

Thermal storage - A sleeping giant

15 p0304 A77-36427

An assessment of energy storage systems suitable for use by electric utilities

15 p0310 A77-36982

Energy management for commercial buildings and cooling storage [AIAA 77-1004]

16 p0402 A77-41552

Energy conservation by symbiosis

16 p0408 A77-41852

Lessons learned from Atlanta /towns/ solar experiment --- solar heating and cooling for school

16 p0423 A77-44491

Energy demand studies: Major consuming countries. Analyses of 1972 demand and projections of 1985 demand --- Book

16 p0428 A77-46094

BI-gas pilot plant processes 5 tph --- bituminous coal gasification

16 p0441 A77-48478

Practicability study of Stirling total energy systems

16 p0465 A77-48882

Commercial applications of solar total energy systems

16 p0468 A77-48904

Solar process heat from concentrating flat-plate collectors

16 p0474 A77-48957

Heating of buildings with solar energy

16 p0474 A77-48959

Solar heating and cooling in a commercial building

16 p0477 A77-48983

A solar/Stirling total energy system

16 p0481 A77-49021

The design of a solar cooling and heating system for a commercial building

16 p0497 A77-49148

National Emissions Data Systems (NEDS) fuel use report, 1973 [PB-253908/8]

13 p0083 A77-10220

National benefits associated with commercial application of fuel cell powerplants [ERDA-76-54]

13 p0123 A77-14597

Commercial application of laser fusion [LA-76-1459]

14 p0227 A77-19872

General Electric Company proposed management plan, commercial buildings, National Solar Demonstration Program [COO-2683-76-3]

14 p0229 A77-20568

General Electric Company proposed demonstration Projects Matrix, commercial buildings, National Solar Demonstration Program [COO-2683-76-5]

14 p0230 A77-20569

Proposed management plan, commercial buildings --- solar heating and cooling demonstration [COO-2683-76-8]

14 p0230 A77-20570

Proposed test and evaluation plan, commercial buildings --- solar heating and cooling demonstration [COO-2683-76-9]

14 p0230 A77-20571

Proposed demonstration Projects Matrix, commercial buildings --- solar heating and cooling demonstration [COO-2683-76-10]

14 p0230 A77-20572

Solar energy in buildings: Implications for California energy policy [NASA-CR-152686]

15 p0343 A77-22613

National program for solar heating and cooling of buildings: Project data summaries. Volume 1: Commercial and residential demonstration [ERDA-76-127]

15 p0346 A77-22639

Interim performance criteria for solar heating and cooling systems in commercial buildings [PB-262114/2]

15 p0348 A77-22669

Study of future paratransit requirements [PB-264082/9]

15 p0376 A77-26028

# CONTINUATION

# SUBJECT INDEX

Energy management in residential and small commercial buildings [BNL-50576] 15 p0392 N77-27511

**COMMUNICATION**  
Desulfurization of coal by use of chemical communication 16 p0418 A77-43009

**COMMODITIES**  
A summary of the DABPA energy and materials shortages programs, fiscal years 1972-1976 [AD-A036021] 15 p0375 N77-25677

**COMMUNICATION SATELLITES**  
Power source requirements of electric propulsion systems used for north-south stationkeeping of communication satellites 13 p0040 A77-12833

The nuclear spinner for Satcom applications --- comparing nuclear and solar power supplies 13 p0041 A77-12838

UK, T5 ion engine thrust vector control considerations [AIAA PAPER 76-1064] 13 p0045 A77-13030

Status of development and application of gas-stabilized heat-pipe radiators [DGLR PAPER 76-192] 13 p0060 A77-16557

Space: A resource for earth - An AIAA review --- Book 15 p0269 A77-32440

New themes for space: Mankind's future needs and aspirations; Proceedings of the Bicentennial Space Symposium, Washington, D.C., October 6-8, 1976 16 p0430 A77-46627

Past experience - Basis for future advanced power systems for communications satellites [IAF PAPER 77-22] 16 p0506 A77-51390

On the active and passive CETI from earth satellite orbit --- communication with extraterrestrial intelligence [IAF PAPER A-77-48] 16 p0507 A77-51524

Space solar power versus space communications [IAF PAPER A-77-65] 16 p0507 A77-51532

**COMMUNICATIONS TECHNOLOGY SATELLITE**  
Preliminary report on the CTS transient event counter performance through the 1976 spring eclipse season [NASA-TM-X-73487] 13 p0083 N77-10116

Test program for transmitter experiment package and heat pipe system for the communications technology satellite [NASA-TM-X-3455] 13 p0095 N77-11268

Transmitter experiment package for the communications technology satellite [NASA-CR-135035] 15 p0360 N77-24332

**COMMUNITIES**  
Feasibility of heating domestic hot water for apartments with solar energy [AD-A028418] 14 p0209 N77-16461

Economic study of solar total energy [SAND-76-5291] 14 p0216 N77-18574

Summary description of the BOOM1 model --- simulating power plant impact on isolated communities [LA-6424-HS] 15 p0369 N77-25010

Weather, climate and human settlements [WHO-448] 15 p0387 N77-27038

Santa Clara, California, community center, commercial solar demonstration legal alternatives, implications, and financing of solar heating and cooling by a municipal corporation [SAN/1063-76/1] 15 p0394 N77-27549

**COMPARISON**  
A parametric utility comparison of coal and nuclear electricity generation [PB-266064/5] 16 p0523 N77-29634

**COMPATIBILITY**  
Heat pipe materials compatibility [NASA-CR-135069] 13 p0103 N77-12182

**COMPLEX SYSTEMS**  
Principles and application of systems in engineering as rational aid for economy, state, and research; Meeting, Bonn, West Germany, November 9, 10, 1976, Communications 14 p0191 A77-27032

Idealization of complex dynamic systems with examples involving electrical energy systems --- Russian book 16 p0434 A77-47331

**COMPOSITE MATERIALS**  
Software aspects of super composites --- composition selection to meet user requirements 13 p0053 A77-15301

Survey of selective absorber coatings for solar energy technology 14 p0199 A77-29067

Composite technology - The boom is under way --- rotorcraft materials 15 p0287 A77-33616

The use of composite flywheels for braking energy recovery in road transport vehicles 16 p0401 A77-41351

Energy storage - An interference assembled multiring superflywheel 16 p0450 A77-48761

Cost/benefit assessment of the application of composite materials to subsonic commercial transport engines [NASA-TM-X-73557] 13 p0111 N77-13064

A study of the failure of joints in composite material fuel cells due to hydraulic ram loading [AD-A027258] 13 p0117 N77-14016

Composite material structures for thermophotovoltaic conversion radiator [AD-A026859] 13 p0132 N77-15519

Design development of advanced composite flywheels [AD-A030712] 14 p0214 N77-18230

Composite fiber flywheel for energy storage [UCL-78085] 14 p0225 N77-19645

Fiber composite program for flywheel applications [UCL-50033-76-1] 15 p0345 N77-22633

**COMPOSITE STRUCTURES**  
High-speed flywheels as possible energy storage devices in the future 13 p0056 A77-15856

Advanced low-mass solar array technology [AIAA PAPER 77-488] 14 p0173 A77-23908

Optimization of composite flywheel design 15 p0260 A77-31044

Fabrication and assembly of large composite structures in space [AIAA PAPER 77-543] 15 p0266 A77-32065

Composite fiber flywheel for energy storage 15 p0306 A77-36672

Self-regulating composite bearingless wind turbine 16 p0491 A77-49095

**COMPOSITION (PROPERTY)**  
Heating oils, 1976 [BERC/PPS-76/4] 15 p0344 N77-22626

**COMPRESSED AIR**  
Compressed air energy storage - A near term option for utility application 13 p0027 A77-12727

Compressed air energy storage [AIAA 77-1008] 16 p0403 A77-41555

Conceptual design of underground compressed air storage electric power systems 16 p0451 A77-48770

Compressed air energy storage for electric utility load leveling 16 p0458 A77-48825

Compressed air storage for load leveling of nuclear power plants 16 p0459 A77-48826

An assessment of mechanical energy storage for solar systems 16 p0460 A77-48839

Economic and technical feasibility study of compressed air storage [COG-2559-1] 13 p0122 N77-14593

Technical and economic feasibility analysis of the no-fuel compressed air energy storage concept [BNWL-2065] 14 p0225 N77-19643

Preliminary feasibility evaluation of compressed air storage power systems, volume 1 [CONS/NSF/42-1] 16 p0556 N77-33636

**COMPRESSED GAS**  
Reciprocating pump for conversion of liquid hydrogen to high pressure gaseous hydrogen 15 p0284 A77-33409

**COMPRESSIBILITY EFFECTS**  
Hydrogen as a fuel in compression ignition engines 13 p0071 A77-18932

Energy storage, compression, and switching --- Book 15 p0299 A77-36284

- COMPRESSIBLE BOUNDARY LAYER**  
Boundary-layer separation from the electrode wall  
of an MHD generator 13 p0048 A77-13711
- COMPRESSION TESTS**  
Minor radius compression experiments --- for ohmic  
heating efficiency improvement in Tokamaks 16 p0407 A77-41683
- COMPRESSIVE STRENGTH**  
Reinforced pillow solar water heater 16 p0493 A77-49114
- COMPRESSOR EFFICIENCY**  
10 design principles for air-to-air heat pumps 16 p0408 A77-41824  
Investigating the starting modes of the GT-35 gas  
turbine plant --- turbocompressor tests 16 p0426 A77-45324
- COMPRESSORS**  
A hydride compressor 13 p0046 A77-13336  
Emissions from compressor stations --- noise  
pollution 15 p0287 A77-33545  
Procedure for calculating thermocompressor  
thermodynamical parameters --- for solar energy  
conversion 16 p0442 A77-48519
- COMPUTATION**  
Comparison of calculated and measured maximum  
aboveground air pollutant concentrations and  
their respective distances from the source of  
release of large power plants [ORNL-TR-4231] 15 p0386 A77-26712
- COMPUTER GRAPHICS**  
Computer graphics demonstration: Area coal  
availability studies [PB-267923/1] 16 p0541 A77-31824
- COMPUTER PROGRAMMING**  
Development of signal processing algorithms for  
ultrasonic detection of coal seam interfaces  
[NASA-CR-150024] 13 p0085 A77-10610  
Design and modeling of solar sea power plants by  
geometric programming [COO-2895-T1] 14 p0231 A77-20585  
Overview of MINPACK [CONF-760842-19] 15 p0396 A77-27761
- COMPUTER PROGRAMS**  
Software aspects of super composites ---  
composition selection to meet user requirements 13 p0053 A77-15301  
Computational program for accurate  
predetermination of irradiance and illuminance  
in connection with solar energy utilization 14 p0147 A77-21777  
Balance and optimization procedure for  
thermochemical cycles for hydrogen production 15 p0276 A77-33345  
OPTIMO - A method for process evaluation applied  
to the thermochemical decomposition of water 15 p0320 A77-38526  
Use of calculated displaced shapes to define the  
reflected light pattern from a focused collector 16 p0473 A77-48948  
Solar system market capture in the  
climato-economic regions of the United States 16 p0493 A77-49116  
Solar heating and cooling computer analysis - A  
simplified sizing design method for non-thermal  
specialists 16 p0497 A77-49157  
Planning models for the assessment of advanced  
energy storage systems 13 p0105 A77-12504  
A design procedure for solar heating systems 13 p0128 A77-15485  
Cooperative study of heavy duty diesel emission  
measurement methods [PB-257137/0] 13 p0133 A77-15541  
InterTechnology Corporation proposed systems level  
plan for solar heating and cooling, commercial  
buildings. Volume 2: National solar  
demonstration program [COO-2688-76-6-VOL-2] 14 p0224 A77-19633  
Engineering-economic model of residential energy use  
[ORNL-TR-5470] 14 p0231 A77-20580  
A computer program to calculate and plot  
wind-generated stored energy at constant  
consumption [AD-A029977] 15 p0356 A77-23613
- Economy-wide impacts of interfuel substitution:  
Substitution of electricity for imported oil  
[BNL-50538] 15 p0369 A77-24998  
Project Independence Evaluation System (PIES)  
documentation. Volume 1: The integrating model  
of the Project Independence Evaluation System  
[PB-263020/0] 15 p0374 A77-25661  
University of Utah direct contact Geothermal Power  
Project report. A computer program for  
determining the thermodynamic properties of water  
[UTEC-82-76-171] 15 p0380 A77-26642  
Optimization technique for geothermal power plants  
using a binary fluid cycle [BNWL-2155] 15 p0394 A77-27546  
Land use, energy flow and policy making in  
society. SIMPAC handbook. A guide to the  
modeling of socio-economic phenomena  
[PB-267134/5] 16 p0530 A77-30637  
GDIST: A computer code for analysis of  
statistical distributions of physical data  
[PB-266762/4] 16 p0533 A77-31589  
Comparison of computer-predicted and observed  
energy uses in a multi-family high-rise  
apartment building [PB-267829/0] 16 p0539 A77-31665  
ENFORM: An energy information system  
[BNWL-2195] 16 p0542 A77-32016  
Dimensions, volume 61, no. 5 [PB-267321/8] 16 p0542 A77-32027
- COMPUTER TECHNIQUES**  
High-efficiency thin silicon solar cells 14 p0148 A77-21786  
Analysis of steranes and triterpanes in geolipid  
extracts by automatic classification of mass  
spectra 15 p0260 A77-31262  
Thermochemical production of hydrogen - Myth or  
reality 15 p0270 A77-32593  
Definition and analysis of thermochemical  
processes for hydrogen production based on  
iron-chlorine reactions 15 p0276 A77-33351  
Quasi-analog models of large systems of algebraic  
equations 16 p0433 A77-46959  
Microcomputer processor for monitoring of solar  
heated buildings 16 p0481 A77-49015  
Directory of Federal energy data sources:  
Computer products and recurring publications  
[PB-254163/9] 13 p0093 A77-10941  
Applying computer-drawn maps of geologic data to  
analysis of mining problems [PB-255497/0] 13 p0096 A77-11518
- COMPUTERIZED DESIGN**  
Design principles for solar and wind power  
installations 13 p0015 A77-11922  
Heat pipe heat exchanger design considerations 13 p0031 A77-12765  
Long term performance prediction of residential  
solar energy heating systems 13 p0039 A77-12822  
Software aspects of super composites ---  
composition selection to meet user requirements 13 p0053 A77-15301  
Arrays of fixed flat-plate solar energy collectors  
- Performance comparisons for differing  
individual component orientations 13 p0068 A77-18449  
Computational program for accurate  
predetermination of irradiance and illuminance  
in connection with solar energy utilization 14 p0147 A77-21777  
A practical solar concentrator 14 p0171 A77-23657  
Efficiency calculations for Al/x/Ga/1-x/As-GaAs  
heteroface solar cells 15 p0257 A77-30720  
Re-entrant groove heat pipe --- computerized  
design for OAO applications [AIAA PAPER 77-773] 15 p0312 A77-37280  
An optimization approach to the design of the  
preheater for a magnetohydrodynamic powerplant 15 p0318 A77-38207

## COMPUTERIZED SIMULATION

## SUBJECT INDEX

- Conceptual heliostat field design for the ERDA 5  
Megawatt Solar Thermal Test Facility at Sandia,  
Albuquerque 15 p0318 A77-38209
- Conceptual design of a parabolic dish solar  
collector using simulation techniques 15 p0318 A77-38211
- An integrated process model of the Fischer-Tropsch  
process for liquid fuels production from coal 15 p0318 A77-38213
- A site sensitive solar collector evaluator 16 p0473 A77-48947
- Solar heating and cooling computer analysis - A  
simplified sizing design method for non-thermal  
specialists 16 p0497 A77-49157
- Innovative Aircraft Design Study (IADS) task 2,  
volume 1 [AD-A041234] 16 p0531 N77-31141
- COMPUTERIZED SIMULATION**
- Equation solution accuracy in calculating jet  
engine characteristics 13 p0020 A77-12502
- Modeling residential energy use 13 p0027 A77-12726
- Economic optimization of binary fluid cycle power  
plants for geothermal systems 13 p0029 A77-12744
- The use of program GEOTRM to design and optimize  
geothermal power cycles 13 p0031 A77-12758
- The potential national benefits of geothermal  
electrical energy production from hydrothermal  
resources in the West 13 p0031 A77-12760
- Alternative strategies for implementing  
silicon-ribbon technology for photovoltaic  
applications 13 p0039 A77-12819
- Optimal material selection for flat-plate solar  
energy collectors utilizing commercially  
available materials 13 p0068 A77-18444
- A new method for collector field optimization ---  
computerized simulation of solar tower facility 13 p0074 A77-19070
- Solar-powered housing unit - Simulation of solar  
heating and cooling in Saudi Arabia 13 p0078 A77-19110
- A comparison of solar absorption air conditioning  
systems 14 p0158 A77-22647
- Simulation of wind turbine generator system power  
flow dynamics 14 p0158 A77-22650
- The computer simulation of automobile use patterns  
for defining battery requirements for electric  
cars 14 p0159 A77-22879
- Method for estimating solar heating and cooling  
system performance 14 p0170 A77-23653
- Recovery of heat energy from deep or shallow  
aquifers 14 p0175 A77-24206
- An economic analysis of thermic diode solar panels  
[ASME PAPER 76-WA/SOL-7] 14 p0188 A77-26512
- Design and simulation studies for the Shenandoah  
Community Center large-scale solar cooling  
demonstration [ASME PAPER 76-WA/SOL-15] 14 p0189 A77-26520
- Modeling of electric drive systems for KEW  
/flywheel/ vehicles 14 p0200 A77-29469
- Studies on the energy system of Hokkaido. I -  
First attempt: Model-I. II - Various data and  
their basis. III - Simulations by Model-I 15 p0287 A77-33526
- Residential energy use alternatives to the year 2000  
15 p0307 A77-36768
- The Wisconsin Regional Energy project - An applied  
systems analysis approach to regional  
energy/environment modeling 15 p0309 A77-36825

## SUBJECT INDEX

## CONVECTIVE FLOW

Identification and analysis of mid-Atlantic onshore OCS impact  
[PB-254925/1] 13 p0096 N77-11516

Outer continental shelf oil and gas costs and production volume: Their impact on the nation's energy balance to 1990  
[PB-262533/3] 15 p0343 N77-22604

Research and development assessment on safety and pollution control for outer continental shelf operations  
[AD-A034727] 15 p0357 N77-23635

A social and economic impact study of offshore petroleum and natural gas development in Alaska, phase 2  
[PB-264706/3] 15 p0385 N77-26693

Alaska OCS socioeconomic studies program, literature survey  
[PB-269244/0] 16 p0549 N77-32681

**CONTROL**  
Evaluation of molten scrubbing for fine particulate control  
[PB-266092/6] 16 p0517 N77-28642

**CONTROL CONFIGURED VEHICLES**  
Hydrodynamic equilibrium conditions for AG(EH) main strut-pod foil system using flap incidence control  
[AD-A027521] 13 p0127 N77-15220

**CONTROL EQUIPMENT**  
The status of instrumentation and process control techniques for in situ coal gasification  
[PB-266092/6] 14 p0191 A77-26790

Small scale tests on control methods for some liquefied natural gas hazards  
[AD-A033522] 15 p0341 N77-22293

**CONTROL SIMULATION**  
Application of simulation studies to the design and improvement of fuel control systems for aviation turbine engines  
13 p0054 A77-15798

**CONTROLLABILITY**  
Controllability analysis for passively and actively controlled heat pipes  
[AIAA PAPER 77-776] 15 p0312 A77-37281

**CONTROLLED FUSION**  
Fusion power --- nuclear energy technology development  
13 p0005 A77-11034

Muon catalysed fusion for pellet ignition  
13 p0012 A77-11468

Current status of the magnetic fusion program  
13 p0035 A77-12792

The migma high energy advanced fuel direct conversion fusion power plant  
13 p0035 A77-12794

The prospect for fusion --- controlled nuclear fusion  
13 p0058 A77-16357

Concept of a fusion burner  
13 p0061 A77-17014

A possible correlation of the neutron yield to the electromechanic work in Bather-type plasma focus devices  
13 p0061 A77-17017

World survey of major facilities in controlled fusion research --- Book  
13 p0067 A77-18264

Overview of the ERDA fusion power program  
13 p0068 A77-18446

Lasers and controlled thermonuclear fusion. I  
14 p0135 A77-19918

Electron beam research at Sandia Laboratories, USA --- for inertial confinement fusion  
14 p0138 A77-20706

Superconducting induction coil for a doublet Tokamak experimental fusion power reactor  
14 p0144 A77-21376

Review on the IAEA workshop on large fusion Tokamak projects  
14 p0146 A77-21737

Overview of energy research and development administration inertial confinement fusion program  
14 p0146 A77-21744

Hydrodynamics and compression of a laser irradiated target --- fusion energy requirements  
14 p0146 A77-21745

The current state and prospects for development of controlled thermonuclear fusion  
14 p0157 A77-22537

Status and outlook of controlled nuclear fusion  
14 p0163 A77-23095

Ignition of a pulsed thermonuclear reaction by high-current ion beams  
14 p0164 A77-23106

Prospects for fusion energy  
14 p0178 A77-24928

A direct convertor based upon space charge effects  
14 p0184 A77-26160

Review of the conceptual design of a doublet fusion experimental power reactor  
[ASME PAPER 76-WA/NE-9] 14 p0188 A77-26494

Tokamak experimental power reactor  
[ASME PAPER 76-WA/NE-11] 14 p0188 A77-26496

State of the art of controlled fusion  
14 p0194 A77-27722

The laser solenoid - An alternate use of lasers in fusion power  
14 p0198 A77-28962

The future with fusion power  
14 p0205 A77-29938

The impact of the new energy technologies  
15 p0272 A77-33124

Thermonuclear fusion power  
15 p0296 A77-35920

Systems analysis of accelerator and storage ring systems for inertial fusion  
15 p0334 A77-39744

Design considerations for a migma advanced fuel fusion reactor  
15 p0334 A77-39747

Update on the development of 120-keV multi-megawatt neutral beam source  
15 p0335 A77-39749

Explosion compression of plasma up to critical values of thermonuclear microfusion. I, II  
16 p0400 A77-41201

Adapting the experience of DOD/Industry to developing fusion power reactors  
[AIAA 77-1019] 16 p0404 A77-41561

Heating of the Frascati Tokamak by means of quasi perpendicular neutral injection  
16 p0407 A77-41706

Symposium on Engineering Problems of Fusion Research, 6th, San Diego, Calif., November 18-21, 1975, Proceedings  
16 p0425 A77-44975

Symposium on Clean Fusion, 1st, Washington, D.C., April 30, 1976, Proceedings  
16 p0435 A77-47355

Clean fusion concepts and efforts - A survey  
16 p0435 A77-47356

Studies of deuterium-fueled Tokamak reactors  
16 p0435 A77-47357

The 1976 status of the Migma program of controlled fusion  
16 p0435 A77-47360

Impact of advanced fuel fusion on electric power transmission  
16 p0436 A77-47361

Fusion products detection system in Migmacell II  
16 p0436 A77-47363

Methods of 'tailoring' ion distributions in phase space /'morphodynamics'/ --- in Migma-type fusion reactors  
16 p0436 A77-47364

Conditions for a boron fusion reactor in the MeV range  
16 p0436 A77-47366

Advanced fuel fusion application to manned space propulsion  
16 p0436 A77-47367

Generalized criterion for controlled fusion  
16 p0436 A77-47368

Unified criterion for proximity to controlled fusion  
16 p0436 A77-47369

Optimization of confinement in a toroidal plasma subject to strong radial electric fields  
16 p0438 A77-47958

Development of new technologies for energy production in the Federal Republic of Germany  
16 p0505 A77-51157

Enhanced energy utilization from a controlled thermonuclear fusion reactor  
[PB-260653/1] 14 p0234 N77-20879

**CONVECTIVE FLOW**  
Storage tanks - A numerical experiment --- for solar heating  
14 p0180 A77-25898

## CONVECTIVE HEAT TRANSFER

- Increase in the efficiency of heat and power systems using large artificial accumulators of heat  
13 p0064 A77-17939

## SUBJECT INDEX

## COST ESTIMATES

Energy extraction characteristics of hot dry rock geothermal systems 16 p0455 A77-48798

Cost and performance comparison of flash binary and steam turbine cycles for the Imperial Valley, California --- in geothermal resources exploitation 16 p0455 A77-48801

Compressed air energy storage for electric utility load leveling 16 p0458 A77-48825

Design of sodium-cooled, central receiver solar power plant 16 p0461 A77-48843

Miniature solar-electric power system 16 p0462 A77-48848

Experimental evaluation of a solar/wind-powered space heating and hot water heating system in the Pacific Northwest 16 p0462 A77-48849

Solar residential demonstration program 16 p0469 A77-48914

Recent Canadian activities in biomass 16 p0470 A77-48917

ERDA Solar Thermal Energy Program for industrial process heat 16 p0470 A77-48922

Summary of the role of planning and analysis in the development of the Federal solar energy program 16 p0470 A77-48923

Application of solar principles in designing a low cost system for warehouse heating 16 p0476 A77-48969

Cost effective solar heating of houses with seasonal storage of energy 16 p0481 A77-49016

Shallow solar ponds for industrial process heat - The ERDA-Sohio project 16 p0482 A77-49024

Economic aspects of Ocean Thermal Energy Conversion 16 p0484 A77-49041

Preliminary research on Ocean Energy Industrial Complexes 16 p0484 A77-49042

Wind energy statistics for large arrays of wind turbines - New England and Central U.S. regions 16 p0490 A77-49091

The application of wind power systems to the Minnesota Power and Light Company 16 p0490 A77-49092

Diffuser augmentation of wind turbines 16 p0490 A77-49093

Gravel and liquid storage system for solar thermal power plants 16 p0491 A77-49101

High-temperature energy storage in native rocks 16 p0492 A77-49104

Thermal energy storage using large hollow steel ingots 16 p0492 A77-49106

An assessment of hydrogen as a means to store solar energy 16 p0492 A77-49107

Thermal energy storage by the sulfuric acid-water system 16 p0492 A77-49108

Reinforced pillow solar water heater 16 p0493 A77-49114

Payback of solar systems --- cost effectiveness evaluation by dynamic economical model 16 p0493 A77-49115

The feasibility of solar house heating - A study in applied economics 16 p0493 A77-49117

A parametric study of critical fuel costs for solar heating in North America 16 p0493 A77-49118

Incentives and barriers to the development of solar energy 16 p0494 A77-49119

Effect of solar home heating on electric utilities 16 p0494 A77-49123

Economic study of solar total energy 16 p0494 A77-49124

User needs vs. technical demands, or the art of tradeoff in making a good, inexpensive solar home 16 p0495 A77-49134

Design factors for a cost effective solar collection system 16 p0496 A77-49143

Design, fabrication, testing, and delivery of a solar energy collector system for residential heating and cooling [NASA-CR-150032] 13 p0086 N77-10638

Solid Polymer Electrolyte (SPE) fuel cell technology, program review, phase 2 [NASA-CR-150957] 13 p0097 N77-11532

Attic concentrator type solar energy collector [BNL-50493] 13 p0098 N77-11539

Cost/benefit assessment of the application of composite materials to subsonic commercial transport engines [NASA-TN-X-73557] 13 p0111 N77-13064

Study of the cost/benefit tradeoffs for reducing the energy consumption of the commercial air transportation system [NASA-CR-137926] 13 p0126 N77-15007

Study of the cost/benefit tradeoffs for reducing the energy consumption of the commercial air transportation system [NASA-CR-137927] 13 p0126 N77-15008

Hydrogen energy conversion --- for thermodynamic efficiency and cost effectiveness [AD-A030370] 14 p0218 N77-18601

Cost/benefit tradeoffs for reducing the energy consumption of the commercial air transportation system. Volume 1: Technical analysis [NASA-CR-137923] 15 p0353 N77-23072

Cost/benefit tradeoffs for reducing the energy consumption of the commercial air transportation system. Volume 2: Market and economic analyses [NASA-CR-137924] 15 p0353 N77-23073

Study to assess the application of shadow pricing techniques to national energy resource planning [BNL-50537] 15 p0369 N77-24997

Solar pond [NASA-CASE-WFO-13581-2] 16 p0513 N77-28584

Space station systems analysis study. Part 3: Documentation. Volume 1: Executive summary [NASA-CR-151503] 16 p0525 N77-30151

**COST ESTIMATES**

Investigation of heat exchanger flow arrangement on performance and cost in a geothermal binary cycle 13 p0029 A77-12746

Is nuclear energy economically viable --- competition with coal 13 p0045 A77-12933

Air, water, nuclear power make gasoline 13 p0045 A77-12935

Solar-powered refrigeration by intermittent solid absorption systems 13 p0078 A77-19106

On the solar energy problem --- for heat and electric power production 14 p0138 A77-20742

A solar collector of glass 14 p0148 A77-21792

Low-Btu gas from coal has many potential markets 14 p0165 A77-23309

Liquefied natural gas for California 14 p0183 A77-26083

Solar thermal electric power systems - Manufacturing cost estimation and systems optimization [ASME PAPER 76-WA/HT-14] 14 p0186 A77-26474

Microwave energy transmission [AIAA PAPER 77-540] 15 p0266 A77-32063

Economic evaluation by ERDA of alternative fossil energy technologies 15 p0300 A77-36328

Electrochemical energy conversion. I - Electric vehicle propulsion 15 p0303 A77-36410

Factors influencing the economics of large-scale in situ coal gasification operations 15 p0306 A77-36765

Computer model of a solar-assisted heating design approach implemented on a minicomputer installation 15 p0318 A77-38178

Options for the conversion of fossil fuels 15 p0335 A77-39835

Energy management for commercial buildings and cooling storage [AIAA 77-1004] 16 p0402 A77-41552

## COST INCENTIVES

## SUBJECT INDEX

- Satellite solar power - Will it pay off  
[AIAA 77-1027] 16 p0404 A77-41567
- On the realization of projects - With special  
reference to O'Neill space colonies and the like  
16 p0431 A77-46770
- A preliminary cost benefit analysis of space  
colonization 16 p0431 A77-46771
- Photovoltaic applications for the National Park  
Service 16 p0460 A77-48837
- Comparative assessment of orbital and terrestrial  
central power plants 16 p0465 A77-48878

superconducting machinery 14 p0144 A77-21360
- The influence of finite electrode segmentation on  
electrical performances of the Faraday HD  
generator 15 p0309 A77-36936
- Electrode phenomena in slagging MHD channels 15 p0330 A77-39561
- Finite length effects in linear induction machines  
with different iron contours 16 p0413 A77-42629
- Elimination of current concentration due to Hall  
effect by variable resistive electrodes 16 p0418 A77-43119

## CURRENT DISTRIBUTION

- Construction of two-dimensional steady-state  
solution of equations of a nonequilibrium  
magnetized plasma 13 p0065 A77-18130
- Two-dimensional analysis of end effects in  
diagonal type nonequilibrium plasma MHD generator 15 p0297 A77-36097
- Investigation of two-dimensional electric effects  
in a sectional MHD-channel 15 p0317 A77-37930
- Experimental investigation of multiple-loaded  
diagonal conducting wall generators 15 p0325 A77-39529
- The influence of the transverse current  
nonuniformity, caused by current leakages onto  
the insulating walls of the channel, on the  
local characteristics of a nonideal MHD generator 15 p0329 A77-39553
- Three dimensional current distribution in diagonal  
conducting wall channels 15 p0329 A77-39556
- Calculation of end effects in open-cycle MHD power  
generators 15 p0329 A77-39558
- On the construction of plane stationary solutions  
of equations for nonequilibrium magnetized plasma 16 p0420 A77-43705
- Calculation of a three-dimensional model for a  
conduction MHD machine with frame-type electrodes 16 p0425 A77-44694

## CURRENT REGULATORS

- Study of the auxiliaries for lead-acid battery  
systems for peaking power  
[CONS/2114-3] 16 p0556 N77-33634

## CURVATURE

- Solar concentration by curved-base Fresnel lenses  
[NASA-CR-2890] 16 p0524 N77-29946

## CYANO COMPOUNDS

- Investigation of acid-resistant electrocatalysts  
for fuel cells  
[NASA-TT-P-17367] 14 p0207 N77-16444

## CYCLIC HYDROCARBONS

Thermochemistry of some six-membered cyclic and polycyclic compounds related to coal  
16 p0442 A77-48489

## CYCLIC LOADS

A 100-kW metal wind turbine blade basic data, loads and stress analysis  
[NASA-CR-134956] 14 p0236 N77-21467

## CYCLOTRONS

The U-240 cyclotron --- review of systems and processes  
13 p0046 A77-13151

## CYLINDRICAL BODIES

Experimental evaluation of a cylindrical parabolic solar collector  
[ASME PAPER 76-WA/HT-13] 14 p0186 A77-26473  
Structure of the electric field in the near-end space of a cylindrical electrode  
15 p0295 A77-35607  
Optical performance of fixed zenith-moving azimuth parabolic-cylindrical concentrator  
16 p0417 A77-42955  
A note of the economics of deep cylindrical mirror concentrating collectors  
16 p0502 A77-50218

## CYLINDRICAL SHELLS

Performance measurements of a cylindrical glass honeycomb solar collector compared with predictions  
[ASME PAPER 76-WA/SOL-3] 14 p0188 A77-26508  
Numerical solution of heat conduction with phase change in cylindrical systems  
16 p0543 N77-32422

## CZOCHEWSKI METHOD

Advanced technologies for photovoltaic cell fabrication  
14 p0165 A77-23300  
Large area Czochralski silicon for solar cells  
16 p0486 A77-49054

## D

## DAMPING

Investigation of excitation control for wind-turbine generator stability  
[NASA-TM-73745] 16 p0535 N77-31614

## DATA ACQUISITION

Autonomous station for the acquisition and concentration of heliometric data  
13 p0072 A77-19046  
Development of a mobile solar testing and recording /STAR/ system --- trailer for domestic hot water system testing  
13 p0072 A77-19047  
A data acquisition, performance evaluation and monitoring system for solar heated/cooled residential dwellings  
[ASME PAPER 76-WA/SOL-13] 14 p0189 A77-26518  
Comparison of long-term flat-plate solar collector performance calculations based on averaged meteorological data  
15 p0256 A77-30315  
Insolation data for solar energy conversion derived from satellite measurements of earth radiance  
16 p0471 A77-48930  
Site Data Collection System for solar energy applications  
16 p0480 A77-49014  
Space station systems analysis study. Part 1, volume 1: Executive study  
[NASA-CR-151102] 13 p0094 N77-11084  
Space station systems analysis study. Part 1, volume 2: Technical report  
[NASA-CR-151103] 13 p0094 N77-11085  
Process energy reliability requirements for selected industries  
[ORNL-TM-5428] 15 p0364 N77-24594  
Fuels and energy data: United States by states and census divisions, 1973  
[PB-262362/7] 15 p0367 N77-24636  
Electric utility solar energy activities, 1976 survey  
[EPRI-ER-321-SR] 16 p0515 N77-28598  
Project Independence Evaluation System (PIES) documentation. Volume 15: Standard data tables for PIES  
[PB-265195/8] 16 p0523 N77-29629

ENFORM: An energy information system

[BNWL-2195] 16 p0542 N77-32016

## DATA BASES

A thermochemical data bank for cycle analysis --- water decomposition for hydrogen production  
15 p0276 A77-33346  
Distribution of direct and total solar radiation availabilities for the USA  
16 p0471 A77-48926  
ERDA energy information data base: Magnetic tape description  
[TID-4581-R3] 13 p0102 N77-11695  
A thermochemical data bank for cycle analysis  
14 p0238 N77-21578  
Energy model data base program  
[BNL-21545] 14 p0250 N77-21687  
ERDA Interlaboratory Work for Data Exchange (IWGDE)  
[LBL-5329] 15 p0352 N77-22998  
Development and applications of spatial data resources in energy related assessment and planning  
[CONF-761017-1] 15 p0355 N77-23609  
Research leading to the production and early use of numeric data banks of material properties and system analyses  
[UCRL-50038-76-2] 15 p0364 N77-24601  
Transportation-related data bases extracted from the national index of energy and environmental data bases. Part 1: Digest of detailed data base descriptions  
[UCID-17316-PT-1] 15 p0387 N77-27036  
Transportation-related data bases extracted from the national index of energy and environmental data bases. Part 2: Detailed data base descriptions  
[UCID-17316-PT-2] 15 p0387 N77-27037  
A user's guide to the MIT world energy demand data base. Part 2: Data index  
[PB-266830/9] 16 p0539 N77-31660  
Energy Model Data Base (EMDB) using system 2000  
[BNL-21854] 16 p0541 N77-31814  
Accounting systems for energy conservation  
[LA-6569-MS] 16 p0557 N77-33646

## DATA CORRELATION

Liquid fluidized bed heat exchanger - Horizontal configuration experiments and data correlations --- for geothermal applications  
16 p0455 A77-48799  
Energy interrelationships. A handbook of tables and conversions factors for combining and comparing international energy data  
[PB-269034/5] 16 p0559 N77-33675

## DATA MANAGEMENT

The United States National Program for the demonstration of solar heating and cooling in buildings - Progress report  
16 p0470 A77-48918  
Sources of energy data for Illinois  
[PB-262562/2] 15 p0350 N77-22686

## DATA PROCESSING

Processing of experimental data with the U-25 facility with the aid of a data measuring system --- MHD generator  
15 p0269 A77-32521  
Energy consumption measurement: Data needs for public policy  
[PB-266039/7] 16 p0517 N77-28619

## DATA REDUCTION

Microcomputer processor for monitoring of solar heated buildings  
16 p0481 A77-49015  
GDIST: A computer code for analysis of statistical distributions of physical data  
[PB-266762/4] 16 p0533 N77-31589

## DATA STORAGE

Directory of Federal energy data sources: Computer products and recurring publications  
[PB-254163/9] 13 p0093 N77-10941

## DATA SYSTEMS

A data acquisition, performance evaluation and monitoring system for solar heated/cooled residential dwellings  
[ASME PAPER 76-WA/SOL-13] 14 p0189 A77-26518

## DC 10 AIRCRAFT

Air New Zealand's methods of flying the DC-10  
[ATAA PAPER 77-1255] 16 p0421 A77-44343

## DECISION MAKING

- Decision making in the utilisation of the organic fraction of municipal wastes 15 p0299 A77-36272
- An application of the economic-environmental power dispatch --- decision approach for controlling air pollution emission from electric power generation 15 p0317 A77-38121
- Energy R&D modeling for budgetary decisions 15 p0319 A77-38218
- General Electric Company study for defining the number of residential and non-residential projects, National Solar Demonstration Program [COO-2683-76-7] 14 p0217 N77-18579
- Factors affecting the corporate decisionmaking process of air transport manufacturers [NASA-CR-154618] 15 p0387 N77-27020
- Options for demonstrating the use of solar energy in California buildings [NASA-CR-154103] 16 p0513 N77-28582
- Land use, energy flow and policy making in society. SIMPAC handbook. A guide to the modeling of socio-economic phenomena [PB-267134/5] 16 p0530 N77-30637
- National Research Council Committee on Nuclear and Alternative Energy Systems [TID-27435] 16 p0538 N77-31655
- Public participation in energy related decision making, edited transcripts [PB-268781/2] 16 p0559 N77-33674
- DEEP SPACE NETWORK
- Status of Goldstone solar energy system study of the first Goldstone energy project 14 p0235 N77-21126
- DEFENSE INDUSTRY
- Technologies lead to conservation --- in munition plants 15 p0305 A77-36634
- DEFLECTION
- Use of calculated displaced shapes to define the reflected light pattern from a focused collector 16 p0473 A77-48948
- Horizontally mounted solar collector [NASA-CASE-MPS-23349-1] 16 p0529 N77-30613
- DEFOCUSING
- Radiant-vector distribution in the radiant field of a parabolocylindric concentrator 13 p0015 A77-11920
- DEGASSING
- Degasification and production of natural gas from an airshaft in the Pittsburgh coalbed [PB-258101/5] 14 p0210 N77-17555
- DEHUMIDIFICATION
- Energy-efficient desiccant drying/dehumidification using solar or fossil fuel energy 16 p0449 A77-48750
- Study of the application of solar chemical dehumidification system to wind tunnel facilities of NASA Lewis Research Center at Cleveland, Ohio [NASA-CR-149886] 14 p0227 N77-20116
- Application of chemical dehumidification system to a roof fan house at Michoud Assembly Facility at New Orleans, Louisiana [NASA-CR-149888] 14 p0228 N77-20560
- DEHYDRATED FOOD
- Improved, inexpensive solar collectors for agricultural requirements 16 p0488 A77-49077
- Design and performance of an air collector for industrial crop dehydration 16 p0488 A77-49078
- DEHYDRATION
- Hydration-dehydration cycling of MgO-Mg(OH)<sub>2</sub> for application to solar heat storage systems [AI-ERDA-13178] 15 p0381 N77-26654
- DELIVERY
- Flight test development of a helicopter-towed surface delivery system 15 p0317 A77-38006
- DELPHI METHOD (FORECASTING)
- A two-stage forecasting methodology for developing a national energy policy 16 p0419 A77-43144
- Analysis of a Delphi study on hydrogen 14 p0246 N77-21649

## DEMAND (ECONOMICS)

## DESALINIZATION

## SUBJECT INDEX

## DESALINIZATION

Combined production of electrical power and desalinated water by nuclear power plants 15 p0255 A77-30100

Economics of a freeze desalting process using cold seawater effluent of a liquid natural gas plant [PB-259272/3] 14 p0234 N77-20656

**DESICCATORS**

Energy-efficient desiccant drying/dehumidification using solar or fossil fuel energy 16 p0449 A77-48750

**DESIGN ANALYSIS**

An analysis of electric vehicle mission, design, energy impact and cost 13 p0024 A77-12700

Design analyses of a methane-based chemical heat pipe 13 p0028 A77-12737

Wind-power generation on a large scale - A design idea 13 p0050 A77-14531

Termosole flat plate collectors 13 p0073 A77-19058

Cylindrical mirror collector field 13 p0074 A77-19071

High speed superconducting generator 14 p0144 A77-21383

Superconducting a.c. generators - Progress on the design of a 1300 MW, 3000 rev/min generator 14 p0144 A77-21386

A development of high efficiency electric mini-cars 14 p0201 A77-29470

Design analysis of the thin-film CdS-Cu<sub>2</sub>S solar cell 15 p0258 A77-30721

Design of pointed solar concentrators 16 p0417 A77-42954

Optimum design of a single slope solar still in Riyadh, Saudi Arabia 16 p0417 A77-42956

Low-profile heliostat design for solar central receiver systems 16 p0422 A77-44480

Efficient, low cost, concentrating solar collectors 16 p0423 A77-44486

Morphological analysis as a design aid: An application to solar energy conversion processes --- French book 16 p0429 A77-46467

Design of a current technology electric vehicle 16 p0446 A77-48727

Solar collectors --- for heating and cooling of buildings 16 p0471 A77-48935

Design considerations for parabolic-cylindrical solar collectors 16 p0473 A77-48950

Optical and thermal design considerations for ideal light collectors 16 p0474 A77-48956

Design and construction of solar space heating and hot water supply systems for experimental multi-family housing 16 p0477 A77-48979

An analysis on optimal design of solar heating and cooling system for school 16 p0477 A77-48984

The Crain solar house - A case study in the architectural and engineering design process as applied to solar housing for public sale 16 p0496 A77-49140

Report on the design, construction, and marketing of two solar heated SPEC houses 16 p0496 A77-49141

Design phase utility analysis for gas turbine and combined cycle plants [PB-256665/1] 13 p0115 N77-13553

Solar cell array design handbook, volume 1 [NASA-CR-149364] 13 p0118 N77-14193

Solar cell array design handbook, volume 2 [NASA-CR-149365] 13 p0118 N77-14194

Central receiver solar thermal power system. Collector subsystem research experiments [SAN/1111-76/2] 14 p0225 N77-19649

Simple home heating system (what can be done now) [UCRL-77875] 14 p0232 N77-20598

Burner criteria for NO<sub>x</sub> control. Volume 1: Influence of burner variables on NO<sub>x</sub> in pulverized coal flames [PB-259911/6] 14 p0234 N77-20639

Design study of superconducting magnets for a combustion magnetohydrodynamic (MHD) generator [NASA-CR-135178] 14 p0234 N77-20886

Solar power satellite: Analysis of alternatives for transporting material to geosynchronous orbit [NASA-TM-X-74680] 14 p0235 N77-21136

Operations research investigations of satellite power stations [NASA-TM-X-73372] 14 p0236 N77-21547

Design considerations for a noncircular Tokamak demonstration plant [GA-A-14074] 15 p0351 N77-22968

Design considerations for capillary heat pipes at cryogenic temperatures [ORNL-MIT-28] 15 p0361 N77-24430

Experimental evaluation of a breadboard heat and product-water removal system for a space-power fuel cell designed with static water removal and evaporative cooling [NASA-TN-D-8485] 15 p0363 N77-24592

Evaluation of an all-glass, evacuated, tubular, non-focusing, non-tracking solar collector array [TID-27192] 15 p0364 N77-24600

Development of sodium-sulfur batteries for utility application [EPRI-EM-266] 15 p0391 N77-27510

MHD combustor design study --- coal-fired systems [TID-27144] 15 p0396 N77-27923

Design procedure for solar air heating systems [CONF-760842-14] 16 p0514 N77-28589

Optimal design of anisotropic (fiber-reinforced) flywheels [UCRL-52169] 16 p0522 N77-29616

Consideration of design and calibration of terrestrial reference solar cells 16 p0527 N77-30531

A non-aerospace application of plans: Preliminary structural design of wind turbine diffuser [BM-629] 16 p0534 N77-31604

Design and performance of Li-Al/iron sulfide cells for utility energy storage and electric vehicles [CONF-760617-3] 16 p0535 N77-31618

Current fusion power plant design concepts [BNWL-2013] 16 p0549 N77-32894

JET project (design proposal) --- Tokamak experiment [EUR-5516] 16 p0549 N77-32914

Design definition of a mechanical capacitor [NASA-CR-152613] 16 p0552 N77-33603

Design and cost study of a zinc/nickel oxide battery for electric vehicle propulsion [ANL-K-76-3543-1] 16 p0556 N77-33635

Planning and design of additional East Mesa Geothermal Test Facilities. Phase 1B, Volume 2: Procurement package [SAN/1140-1/2-VOL-2] 16 p0558 N77-33657

Design guidelines for energy conserving systems [PB-268989/1] 16 p0559 N77-33670

**DESULFURIZING**

Low-sulfur coal obtained by chemical desulfurization followed by liquefaction 13 p0008 A77-11242

Operation of the Westinghouse Coal Gasification Process Development Unit 13 p0023 A77-12689

Catalytic coal liquefaction using synthesis gas 13 p0059 A77-16473

Desulfurization of flue gases with iron/III/oxide on porous carrier material - Theoretical and experimental investigation concerning the modelling of semicontinuous solid bed reactors with gas-solid reactions --- German book 13 p0080 A77-19184

Flue gas desulfurization experience 14 p0136 A77-20381

Feasibility studies of a biochemical desulfurization method --- using microorganisms as agent from high sulfur containing petroleum 14 p0170 A77-23562

Chemical cleaning of coal [ASME PAPER 76-WA/APC-2] 14 p0184 A77-26409

Applicability of the Meyers Process for desulfurization of U.S. coal /A survey of 35 coal mines/ 14 p0191 A77-27278

Fluidized bed combustion 14 p0192 A77-27290

Nonisothermal hydrogen-induced desulfurization of coal 15 p0287 A77-33544

# SUBJECT INDEX

# DIESEL FUELS

- Operation results of the desulfurization plant for a thermal power station 15 p0299 A77-36279
- Stack gas cleanup --- scrubber systems for high-sulfur coal 15 p0317 A77-37939
- Economic and energy considerations in MHD seed regeneration --- for sulfur oxides removal in coal-fired power plants 15 p0332 A77-39574
- Dynamic characteristics of the desulfurization plant boiler draft system for power stations 15 p0338 A77-40201
- Desulfurization of coal by use of chemical comminution 16 p0418 A77-43009
- Comparative kinetics of high-temperature reaction between H<sub>2</sub>S and selected metal oxides 16 p0424 A77-44608
- Status of sulfur dioxide removal systems for the electric utility industry 16 p0504 A77-51144
- Flue gas desulfurization by fly ash 16 p0504 A77-51146
- Reductant gases for flue gas desulfurization systems [PB-254168/8] 13 p0C92 N77-10722
- Hot fuel gas desulfurization [PB-257036/4] 13 p0133 N77-15539
- Pollutant potential of raw and chemically fixed hazardous industrial wastes and flue gas desulfurization sludges [PB-256691/7] 13 p0133 N77-15540
- Chemically active fluid-bed process for sulphur removal during gasification of heavy fuel oil, phase 3 [PB-268492/6] 16 p0548 N77-32615
- Overview and review of motor gasoline desulfurization, volume 1 [BERC/RI-76/17-VOL-1] 16 p0551 N77-33377
- Motor gasoline desulfurization study, volume 2 [BERC/RI-76/17-VOL-2] 16 p0551 N77-33378
- Evaluation of the disposal of flue gas desulfurization wastes in mines and the ocean: Initial assessment [PB-269270/5] 16 p0561 N77-34058

- DIESEL ENGINES**
- Evolution of thermal traction - From the diesel engine to the gas turbine 13 p0004 A77-10976
- The performance of hydrogen-injected reciprocating engines 13 p0033 A77-12780
- The design and development of a hybrid-electric urban transit vehicle 14 p0159 A77-22876
- Volkswagen develops a diesel 15 p0290 A77-34630
- Biphase turbines for diesel bottoming --- waste heat recovery 16 p0449 A77-48755
- Development status - Binary Rankine cycle waste heat recovery system 16 p0459 A77-48828
- Combined diesel-organic Rankine-cycle power plant 16 p0459 A77-48830
- Preliminary assessment of the potential for medium and large capacity wind generators used as fuel savers for ac diesel based power systems in Ontario 16 p0489 A77-49085
- Performance characteristics of a diesel engine using low- and medium-energy gases as a fuel supplement (fumigation) [NASA-TM-X-58188] 13 p0126 N77-14955
- Federal support for the development of alternative automotive power systems: The general issue and the stirling, diesel, and electric cases [PB-263523/3] 15 p0354 N77-23518
- Engine performance and fire-safety characteristics of water-containing diesel fuels [AD-A036011] 15 p0377 N77-26330
- Feasibility test on compounding the internal combustion engine for automotive vehicles, task 2 [COO-2690-1] 16 p0512 N77-28495
- An experimental study supported by a computer simulation in a prechamber CFR diesel engine leading to a modified cetane scale for rating low ignition quality fuels 16 p0525 N77-30259
- DIESEL FUELS**
- Volkswagen develops a diesel 15 p0290 A77-34630
- Soot and gaseous pollutant formation in a burning fuel spray in relation to pressure and air/fuel ratio 15 p0293 A77-35186
- Report of the Army Scientific Advisory Panel Ad Hoc Group on fire-safe fuels [AD-A023763] 13 p0095 N77-11208
- Fuels and lubricants --- an evaluation of military fuels and lubricants [AD-A032842] 15 p0359 N77-24314
- Thermal stability improvement of diesel fuels of isopropyltadecylamine [NASA-TT-P-17300] 15 p0388 N77-27442
- An experimental study supported by a computer simulation in a prechamber CFR diesel engine leading to a modified cetane scale for rating low ignition quality fuels 16 p0525 N77-30259

Chemical characterization of diesel exhaust  
particulates  
[PERC/RI-77/5] 16 p0540 A77-31671

**DIFFUSE RADIATION**  
A method for estimating hourly averages of diffuse  
and direct solar radiation under a layer of  
scattered clouds --- for solar collector design  
13 p0019 A77-12412  
Computation of solar radiation design curves  
13 p0072 A77-19049  
Concentration of scattered radiation --- by solar  
collectors 15 p0316 A77-37768  
Correlation equation for hourly diffuse radiation  
on a horizontal surface --- insolation on solar  
collectors 16 p0422 A77-44481  
Concentration of diffuse radiation --- by solar  
collectors 16 p0437 A77-47424  
Solar energy conversion with fluorescent collectors  
16 p0499 A77-49166

**DIFFUSERS**  
Potential application of radial splitter diffuser  
to shrouded wind turbines 14 p0199 A77-29071  
Design, construction, and testing of a compact,  
lightweight combustion driven MHD generator  
channel and diffuser 15 p0326 A77-39532  
Subsonic MHD-diffuser performance with high blockage  
15 p0331 A77-39567  
Fluid dynamics of diffuser augmented wind turbines  
16 p0467 A77-48899

**DIFFUSION**  
A non-aerospace application of plans: Preliminary  
structural design of wind turbine diffuser  
[RM-629] 16 p0534 A77-31604

**DIFFUSION WELDING**  
Development and testing of solar water-heating  
boilers manufactured by diffusion welding  
15 p0316 A77-37773  
Development and testing of solar water-heater  
boilers fabricated by diffusion welding  
16 p0437 A77-47429

**DIGESTING**  
Energy balance for anaerobic digestion  
14 p0138 A77-20999  
Packed bed digestion of solid wastes  
15 p0323 A77-39107  
Anaerobic sludge digestion - A potential energy  
source 16 p0439 A77-47970

**DIGITAL DATA**  
Results from circumsolar radiation measurements  
[LBL-5292] 15 p0382 A77-26657

**DIGITAL SIMULATION**  
Performance of an annular cylindrical solar  
collector 13 p0073 A77-19059  
Correlation equation for hourly diffuse radiation  
on a horizontal surface --- insolation on solar  
collectors 16 p0422 A77-44481  
Fusion products detection system in Migma cell II  
16 p0436 A77-47363  
A site sensitive solar collector evaluator  
16 p0473 A77-48947

**DIGITAL TECHNIQUES**  
A mathematical model for the digital computation  
of the hours of sunshine on an inclined plane  
14 p0166 A77-23382  
Modeling algorithms and their implementation on a  
digital computer for calculating the capacity of  
storage cells at wind-power and solar energy  
installations 15 p0316 A77-37775  
Construction and interpretation of a digital  
inertia image --- of Pisgah Crater and Latic  
Lake in Southern California 16 p0421 A77-44464  
Simulation algorithms and their realization by  
digital computer for calculation of wind- and  
solar-plant storage-service capacity 16 p0437 A77-47431

**DIODES**  
Thermic diode solar panels - A brief summary  
16 p0472 A77-48936

**DIRECT CURRENT**  
Pulsed energy conversion with a dc superconducting  
magnet 13 p0081 A77-19293  
Quasi-analog models of large systems of algebraic  
equations 16 p0433 A77-46959  
A theory of control for a class of electronic  
power processing systems: Energy-storage  
dc-to-dc converters  
[NASA-CR-152696] 15 p0344 A77-22614

**DIRECT POWER GENERATORS**  
Energy recovery from saline water by means of  
electrochemical cells 13 p0013 A77-11536  
A microwave energy converter with a reversing  
magnetic field 14 p0139 A77-21154  
A direct convertor based upon space charge effects  
14 p0184 A77-26160  
Terrestrial RTG designs featuring disc-shaped  
thermoelectric modules 16 p0462 A77-48856

**DISCONNECT DEVICES**  
Progress in switching technology for MBTS systems  
--- Magnetic Energy Transfer and Storage  
15 p0303 A77-36377

**DISKS**  
The disk geometry applied to open cycle MHD power  
generation - Experiments and theoretical  
considerations 15 p0325 A77-39531

**DISPLAY DEVICES**  
General Electric Company study for defining the  
number of residential and non-residential  
projects, National Solar Demonstration Program  
[COO-2683-76-7] 14 p0217 A77-18579  
Annual cycle energy system: Initial investigations  
[ORNL-TM-5525] 15 p0364 A77-24599  
Options for demonstrating the use of solar energy  
in California buildings  
[NASA-CR-154103] 16 p0513 A77-28582

**DISSOLVING**  
Mechanisms of coal particle dissolution  
13 p0059 A77-16475

**DISTILLATION**  
Petroleum market shares: A report on sales of  
distillate and residual fuel oil to ultimate  
consumers, 1975  
[PB-260565/7] 15 p0341 A77-22292

**DISTILLATION EQUIPMENT**  
Economic data for a 50,000 BPD Lurgi/Ruhrgas shale  
oil plant 15 p0300 A77-36331

**DISTRIBUTED PARAMETER SYSTEMS**  
Idealization of complex dynamic systems with  
examples involving electrical energy systems ---  
Russian book 16 p0434 A77-47331

**DISTRIBUTING**  
Comparative state-of-the-art assessment of gas  
supply modeling  
[EPRI-EA-201] 16 p0539 A77-31656

**DISTRIBUTION FUNCTIONS**  
Experience in using bimodal distribution curves to  
evaluate the reliability of systems supplying  
energy from renewable sources --- solar and wind  
systems for radio relay links 14 p0201 A77-29535

**DISULFIDES**  
Ambient temperature electric vehicle batteries  
based on lithium and titanium disulfide  
13 p0025 A77-12706  
Post-test analysis of Li/Pes2 compact cells  
16 p0448 A77-48739

**DIURNAL VARIATIONS**  
Selection of optimal pan color for solar water  
heater 13 p0078 A77-19104  
The advantages of sun tracking for planar silicon  
solar cells 14 p0181 A77-25904  
Study of an absorption solar refrigeration unit  
functioning on a round-the-clock basis  
15 p0316 A77-37772  
Investigation of solar absorption cooler for  
round-the-clock operation 16 p0437 A77-47428

## DIVIDERS

The pressure divider - A device for reducing  
gas-pipe-line pumping-energy requirements  
13 p0028 A77-12735

## DOMESTIC ENERGY

- The overccping of energy deficiencies with the aid  
of wind power  
13 p0008 A77-11174

Prospects for coal as a direct fuel and its  
potential through application of liquefaction  
and gasification technology  
13 p0008 A77-11241

The wind and its effect on the heating requirements  
13 p0009 A77-11266

Optimal thermal insulation as an  
investment-computational problem  
13 p0009 A77-11268

The assurance of the heat supply with respect to  
the primary energy use in the case of heating  
and air conditioning installations  
13 p0009 A77-11270

Energy: A radical redirection  
13 p0010 A77-11275

The utility of waters from the high-temperature  
areas in Iceland for space heating as determined  
by their chemical composition  
13 p0012 A77-11496

Energy in the household - Comparison of heating  
costs and prognosis concerning the consumption  
of energy until 1985  
13 p0015 A77-12059

The shaping of our needs in mineral raw materials  
and sources for meeting those needs ---  
Hungarian survey  
13 p0017 A77-12246

Developments in solar energy utilisation in the  
United Kingdom  
13 p0018 A77-12402

The solar water heater industry in South Florida -  
History and projections  
13 p0018 A77-12403

Thermal evaluation of a house using a  
movable-insulation heating and cooling system  
13 p0019 A77-12407

A method of testing for rating solar collectors  
based on thermal performance  
13 p0019 A77-12408

A forced circulation system for solar water heating  
13 p0019 A77-12413

Method of accounting for the ambiguity of initial  
information in the optimization of regional  
fuel/energy balance  
13 p0020 A77-12657

Modeling residential energy use  
13 p0027 A77-12726

Thermal energy storage applied to residential  
heating systems  
13 p0027 A77-12729

Space heating systems new and conventional in the  
Northwest with emphasis on alternate energy  
adaptations  
13 p0028 A77-12736

Geothermal studies in northern Nevada  
13 p0029 A77-12742

Solar-powered Rankine-cycle heat pump system  
13 p0036 A77-12800

New concepts in solar photovoltaic electric power  
systems design  
13 p0038 A77-12817

An integrated photovoltaic/thermal High Intensity  
Solar Energy System /HISES/ concept for  
residential applications  
13 p0039 A77-12818

A summary of solar heating and cooling of  
buildings /SHACOB/ - Phase I demonstration  
planning studies  
13 p0039 A77-12821

Long term performance prediction of residential  
solar energy heating systems  
13 p0039 A77-12822

Experimental evaluation of the University of  
Florida solar powered ammonia/water absorption  
air conditioning system  
13 p0039 A77-12823

Detailed geographic analysis of residential energy  
consumption

Siting of wind driven apparatus  
13 p0043 A77-12865

The consumer's cost of electricity from windmills  
13 p0043 A77-12866

Scientific-technological problems of the  
development of a fuel-energy complex in the USSR  
13 p0051 A77-14703

The potential for application of energy storage  
capacity on electric utility systems in the  
United States. I  
13 p0054 A77-15625

Energy and environmental considerations in  
extending heat pump applications  
13 p0062 A77-17058

Homeowner's guide to solar heating and cooling ---  
Book  
13 p0062 A77-17525

Contribution of the heat carried by solar  
radiation to the thermal balance of a room  
during the cold season and its effect on  
domestic fuel consumption  
13 p0063 A77-17558

A solar house with heat pipe collectors  
13 p0070 A77-18598

Development of a mobile solar testing and  
recording /STAR/ system --- trailer for domestic  
hot water system testing  
13 p0072 A77-19047

Survey of absorption refrigeration systems  
13 p0078 A77-19105

Solar-powered housing unit - Simulation of solar  
heating and cooling in Saudi Arabia  
13 p0078 A77-19110

Preliminary design data for a solar house in  
Riyadh, Saudi Arabia  
13 p0078 A77-19112

Heating a building by means of solar and  
electrical energy  
13 p0078 A77-19113

Application of solar heat to buildings in Austria  
13 p0079 A77-19114

Environmentally designed housing incorporating  
solar energy  
13 p0079 A77-19115

Lumiducts for Ecopolis --- urban solar light  
collection and transmission system  
13 p0079 A77-19116

Water pumping - A practical application of solar  
energy  
13 p0079 A77-19117

Wind power --- wind-powered plant design  
14 p0136 A77-20042

The energy crisis today - A perspective  
14 p0137 A77-20390

Computer van programs - An assessment  
14 p0137 A77-20391

The current status of the U.S. Photovoltaic  
Conversion Program  
14 p0147 A77-21782

Photovoltaic test and demonstration project ---  
residential energy program  
14 p0153 A77-21838

Solar space heating and cooling with Bi-heat  
source heat pump and hot water supply system  
14 p0158 A77-22643

Preliminary performance of CSU Solar House I  
heating and cooling system  
14 p0158 A77-22644

Impacts of future use of electric cars in US cities  
14 p0161 A77-22902

Raw materials for energy generation in Canada  
14 p0165 A77-23315

Clean fuels from biomass

# DRILLS

# SUBJECT INDEX

Drilling for energy resources  
 [PB-259206/1] 14 p0235 N77-20972  
 The Hawaii geothermal project, initial phase 2  
 progress report 15 p0355 N77-23594  
 [PB-263120/8]  
 Thermal gradient and heat flow drilling, volume 5  
 [PB-268422/3] 16 p0544 N77-32577

**DRILLS**  
 New turbodrill for geothermal drilling 16 p0456 A77-48810  
 Thermocorer for geothermal applications 16 p0456 A77-48811

**DROP TRANSFER**  
 Evaporation of solution droplets in a  
 high-temperature medium --- potassium carbonate  
 MHD flow properties 13 p0046 A77-13254  
 Evaporation of a drop of solution in a  
 high-temperature medium --- potassium carbonate  
 MHD flow properties 15 p0263 A77-31534

**DROPS (LIQUIDS)**  
 Infrared extinction spectra of some common liquid  
 aerosols 15 p0290 A77-34561  
 Ignition of droplets of liquid fuels solvent  
 extracted from coal 16 p0508 A77-51588

**DRY CELLS**  
 Review of electrode designs and fabrication  
 techniques for lithium-aluminum/iron sulfide cells 13 p0025 A77-12713  
 Development status of lithium-silicon-iron sulfide  
 load-leveling batteries 13 p0026 A77-12714

**DRY HEAT**  
 LASL hot dry rock geothermal project  
 [LA-6525-PB] 15 p0372 N77-25639

**DRYING**  
 Drying of refuse-derived fuel for energy recovery  
 from municipal solid waste 14 p0182 A77-26071  
 Research on the application of solar energy to the  
 food drying industry [PB-267210/3] 16 p0530 N77-30635

**DRYING APPARATUS**  
 Grain drying in stationary bins with solar heated  
 air 13 p0019 A77-12411

**DUCTED BODIES**  
 Lumiducts for Ecopolis --- urban solar light  
 collection and transmission system 13 p0079 A77-19116

**DUCTED FLOW**  
 A theory and experimental investigation of ducted  
 wind turbines 16 p0410 A77-42072

**DURABILITY**  
 Durability testing at one atmosphere of advanced  
 catalysts and catalyst supports for automotive  
 gas turbine engine combustors, part 1  
 [NASA-CR-135132] 16 p0520 N77-29519

**DUST**  
 Particle size distributions of dusts in the flue  
 gas of power plants and in atmospheric air 15 p0265 A77-31889

**DYES**  
 Photocell using covalently-bound dyes on  
 semiconductor surfaces 16 p0412 A77-42412  
 Photon trapping and energy transfer in  
 multiple-dye plastic matrices - An efficient  
 solar-energy concentrator 16 p0418 A77-43070

**DYNAMIC CHARACTERISTICS**  
 Linear model of a dissipative PWM shunt regulator  
 --- Pulse Width Modulation 13 p0080 A77-19172  
 Dynamic characteristics of the desulfurization  
 plant boiler draft system for power stations 15 p0338 A77-40201  
 On the nature of fluctuations in an open cycle  
 magnetohydrodynamic generator 13 p0117 N77-13841  
 Transfer function analysis of heat pipes 13 p0119 N77-14385  
 Coupled dynamics analysis of wind  
 energy systems [NASA-CR-135152] 14 p0228 N77-20558

Dynamics systems analysis of the relation between  
 energy and the economy [BNL-21667] 14 p0235 N77-20931  
 Dynamic tests of hydrogen-powered IC engines ---  
 for mass transit vehicles 14 p0244 N77-21633

**DYNAMIC CONTROL**  
 Dynamic modeling and control of  
 magnetohydrodynamic/steam electrical power  
 generating plants 15 p0332 A77-39572

**DYNAMIC LOADS**  
 Dynamic blade loading in the ERDA/NASA 100 kW and  
 200 kW wind turbines [NASA-TM-73711] 16 p0528 N77-30599

**DYNAMIC MODELS**  
 A system model for the investigation of  
 alternative energy strategies --- German book 13 p0080 A77-19181  
 A methodological survey of energy modeling 14 p0177 A77-24592  
 Experimental solar heating-cooling system model  
 tests of a full-scale building system 15 p0319 A77-38224  
 Idealization of complex dynamic systems with  
 examples involving electrical energy systems ---  
 Russian book 16 p0434 A77-47331  
 Dynamic modeling of fluidized bed boilers for  
 control system design 16 p0454 A77-48792  
 Dynamic modeling and sensitivity analysis of solar  
 thermal energy conversion systems 16 p0461 A77-48845  
 Payback of solar systems --- cost effectiveness  
 evaluation by dynamic economical model 16 p0493 A77-49115  
 An estimate of the interaction of a limited array  
 of windmills --- feasibility of windpower group  
 station for proposed site [DN-16] 13 p0114 N77-13539

**DYNAMIC PROGRAMMING**  
 Study to assess the application of shadow pricing  
 techniques to national energy resource planning  
 [BNL-50537] 15 p0369 N77-24997

**DYNAMIC STRUCTURAL ANALYSIS**  
 Two general methods for the unsteady aerodynamic  
 analysis of horizontal-axis windmills 16 p0467 A77-48896  
 Some dynamic problems of rotating windmill systems  
 13 p0084 A77-10271  
 A 100-kW wind turbine blade dynamics analysis,  
 weight-balance, and structural test results  
 [NASA-CR-134957] 14 p0236 N77-21468

**DYNAMIC TESTS**  
 Dynamic tests of hydrogen-powered IC engines  
 15 p0282 A77-33395

# E

**EARTH CORE**  
 The flow of heat from the earth's interior 16 p0408 A77-41800

**EARTH CRUST**  
 The question of the utilization of geothermal  
 energy in dry rocks /dry walls/ 15 p0303 A77-36348  
 Geothermal significance of magnetotelluric  
 sounding in the eastern Snake River  
 Plain-Yellowstone region 15 p0310 A77-36999  
 Cross structural plan of the earth's crust and the  
 problem of the manifestation of its plutonic  
 elements on the surface (Tian-Shan and Turan  
 plate as examples) [NASA-TT-P-16938] 13 p0117 N77-13590

**EARTH ENVIRONMENT**  
 Environmental impact of space manufacturing  
 [AIAA PAPER 77-539] 15 p0266 A77-32062

**EARTH ORBITS**  
 Power satellite construction location considerations  
 --- orbital assembly for solar energy conversion 16 p0463 A77-48869

**EARTH PLANETARY STRUCTURE**  
 The flow of heat from the earth's interior 16 p0408 A77-41800

**EARTH RESOURCES**  
 The energy problem and the earth's fuel situation 13 p0004 A77-11027

# SUBJECT INDEX

# ECONOMIC ANALYSIS

Energy analysis in modelling 13 p0007 A77-11047

A word on worldwide petroleum resources 13 p0011 A77-11336

Concerning world oil resources. II - Statistical logistic models /King Hubbert's models/ 13 p0011 A77-11339

World oil resources. III - The geological analogy method 13 p0012 A77-11341

World petroleum resources. IV - Probabilistic methods 13 p0012 A77-11342

The world's oil resources. V - Recovery rates 13 p0012 A77-11343

Synthetic fuels - Prices, prospects, and prior art 13 p0017 A77-12236

Energy: Conversion and utilization --- Book 13 p0052 A77-14957

Geothermal sources and their utilization 13 p0055 A77-15803

Perspectives for world energy production 13 p0056 A77-16202

More about geothermal steam or the hottest energy prospect ever --- Book 14 p0191 A77-26925

Net energy analyses for liquid-dominated and vapor-dominated hydrothermal energy-resource developments 14 p0194 A77-27351

World coal resources and the role of coal in turn-of-the-century energy economy 14 p0198 A77-28758

Unconventional petroleum and natural gas resources. II - Additional gas resources 14 p0198 A77-28760

Energy and natural resources 15 p0263 A77-31574

Space: A resource for earth - An AIAA review --- Book 15 p0269 A77-32440

'Free' and renewable energy sources 15 p0289 A77-34306

Overview of energy supply and demand 15 p0313 A77-37653

Wastes and biomass as energy resources - An overview 15 p0313 A77-37654

Research to anticipate environmental impacts of changing resource usage [PB-256293/2] 13 p0101 N77-11602

An application of ERTS technology to the evaluation of coal strip mining and reclamation in the northern Great Plains [NASA-CR-149208] 13 p0104 N77-12486

The spatial characteristics of three Wyoming fuels [AD-A030873] 14 p0233 N77-20612

A process for coastal resource management and impact assessment [PB-264811/1] 15 p0376 N77-26004

Long-term natural resource availability: Environmental and political implications in the United States [PB-265762/5] 16 p0511 N77-28327

Polar energy resources potential [GPO-76-187] 16 p0520 N77-29605

Space technology in the discovery and development of mineral and energy resources 16 p0526 N77-30289

A screening for potentially critical materials for the National stockpile [PB-267214/5] 16 p0533 N77-31595

Energy Technologies for the West: Geothermal; Energy from the earth [TID-27431] 16 p0537 N77-31642

Role of renewable energy technologies in developing countries [BNL-22311] 16 p0556 N77-33638

**EARTH RESOURCES PROGRAM**

Acid mine drainage - The problem and the solution 16 p0425 A77-45125

Spinoff 1977: An annual report [NASA-TM-74908] 16 p0561 N77-34049

**EARTH RESOURCES SURVEY AIRCRAFT**

Microwave radiometry of land and water areas on the earth surface from onboard aircraft laboratories 16 p0433 A77-47201

**EARTH SURFACE**

Determination of average ground reflectivity for solar collectors 14 p0181 A77-25903

The flow of heat from the earth's interior 16 p0408 A77-41800

Microwave radiometry of land and water areas on the earth surface from onboard aircraft laboratories 16 p0433 A77-47201

Cross structural plan of the earth's crust and the problem of the manifestation of its plutonic elements on the surface (Tyan-Shan and Turan plate as examples) [NASA-TT-F-16938] 13 p0117 N77-13590

**EARTH TIDES**

Predicting changes in tidal regime - The open boundary problem --- for tidepower generation 14 p0199 A77-29076

**EARTHQUAKES**

Earthquake surveys of the Roosevelt Hot Springs and the Cove Fort areas, Utah, volume 4 [PB-268421/5] 16 p0544 N77-32574

**ECLIPSES**

Preliminary report on the CTS transient event counter performance through the 1976 spring eclipse season [NASA-TM-X-73487] 13 p0083 N77-10116

**ECOLOGY**

Combined studies of the sun and isotope ecology 15 p0271 A77-32868

Can we control the carbon dioxide in the atmosphere 15 p0322 A77-38674

Utility views of MHD power generation [AIAA 77-1010] 16 p0403 A77-41557

Critical areas: Satellite power systems concepts [NASA-TM-X-74694] 15 p0362 N77-24585

Ecological review of hydroelectric reservoirs in Puerto Rico [CEER-1] 16 p0540 N77-31673

Interagency energy/environment research and development program: Status report 3 [PB-267443/0] 16 p0558 N77-33662

**ECONOMIC ANALYSIS**

Principles of energy analysis 13 p0007 A77-11045

Energy analysis in modelling 13 p0007 A77-11047

Higher electric power use reduces energy consumption for same gross national product 13 p0011 A77-11334

The mysteries of nuclear programs --- energy conversion efficiency 13 p0011 A77-11337

The economics of coal supply - The state of the art 13 p0013 A77-11523

Optimization criteria for solar and wind power systems 13 p0015 A77-11923

The significance of coal in the future energy picture 13 p0018 A77-12247

Comparative economics for the Arthur D. Little extractive coking process --- coal liquefaction 13 p0022 A77-12684

Modeling residential energy use 13 p0027 A77-12726

An evaluation of the use of metal hydrides for solar thermal energy storage 13 p0028 A77-12739

The economic generation of electricity from moderate temperature geothermal resources 13 p0030 A77-12749

Preliminary analysis of electric generation utilizing geopressured geothermal fluids 13 p0030 A77-12752

The potential national benefits of geothermal electrical energy production from hydrothermal resources in the West 13 p0031 A77-12760

An engineering feasibility study of using low temperature geothermal sources in Colorado 13 p0031 A77-12762

Benefits of hydrogen production research 13 p0032 A77-12768

Economic optimization of the energy transport component of a large distributed solar power plant 13 p0037 A77-12807

- An integrated photovoltaic/thermal High Intensity Solar Energy System /HISES/ concept for residential applications 13 p0039 A77-12818

## SUBJECT INDEX

## ELECTRIC POWER

Introduction to the ERDA electric and hybrid demonstration program --- electric and hybrid vehicle research and development 16 p0420 A77-43675

Some UK progress in sodium sulphur technology --- battery for electric motor vehicles [SAE PAPER 770280] 16 p0424 A77-44563

A study of the effects of new transportation systems on urban transportation and environment by computer simulation 16 p0430 A77-46652

The consumer's electric car --- Book 16 p0431 A77-46786

The zinc-bromine battery - Possible candidate for electric vehicles and load leveling 16 p0446 A77-48725

The design and development of a 30 kW-hr lithium-aluminum/iron sulfide electric vehicle battery 16 p0446 A77-48726

Design of a current technology electric vehicle 16 p0446 A77-48727

Flywheel module for electric vehicle regenerative braking 16 p0447 A77-48728

Results of baseline tests of the Lucas Limousine [NASA-TN-X-73609] 14 p0214 A77-17947

Long term energy alternatives for automotive propulsion. Synthetic fuel versus battery/electric system [PB-262512/7] 15 p0361 A77-24504

Long term energy alternatives for automotive propulsion: Synthetic fuel versus battery/electric system [PB-262513/5] 15 p0361 A77-24505

Design and performance of Li-Al/iron sulfide cells for utility energy storage and electric vehicles [CONF-760617-3] 16 p0535 A77-31618

Evaluation of battery models for prediction of electric vehicle range [NASA-CR-155045] 16 p0546 A77-32593

Design and cost study of a zinc/nickel oxide battery for electric vehicle propulsion [ANL-K-76-3543-1] 16 p0556 A77-33635

**ELECTRIC MOTORS**

Research on battery-operated electric road vehicles 14 p0146 A77-21701

Studies of electric vehicle drives, illustrated by the example of an urban estate car 14 p0160 A77-22893

Comparison of electric drives for road vehicles 14 p0162 A77-22918

The design, fabrication and testing of a five megajoule monopolar motor-generation --- energy storage for controlled fusion experiments 15 p0299 A77-36311

Demonstration of an inductor motor/alternator/flywheel energy storage system [COO-4010-1] 16 p0535 A77-31620

**ELECTRIC NETWORKS**

Allocation of standby power units in terms of the output power, in planning the development of power systems 14 p0167 A77-23406

Hydrogen cycle peak-shaving on the New York State Grid using fuel cells 14 p0199 A77-29094

Pulsed energy and switching requirements for Tokamak ohmic heating [LA-UR-76-2473] 15 p0397 A77-27932

**ELECTRIC POTENTIAL**

Open-circuit voltage of silicon solar cells 14 p0151 A77-21820

A simplified technique for determining the boundary layer voltage loss in MHD generators 16 p0416 A77-42897

Low arc drop hybrid mode thermionic converter 16 p0466 A77-48890

**ELECTRIC POWER**

Photovoltaic and thermal energy conversion for solar powered satellites [IAF PAPER 76-117] 13 p0003 A77-10913

Satellite power systems for large-scale power generation [IAF PAPER 76-118] 13 p0003 A77-10914

Higher electric power use reduces energy consumption for same gross national product 13 p0011 A77-11334

The mysteries of nuclear programs --- energy conversion efficiency 13 p0011 A77-11337

Characteristic aspects of the evolution of the French electric balance in 1975 13 p0012 A77-11340

Development of compound parabolic concentrators for solar-thermal electric and process heat applications 13 p0038 A77-12812

Is nuclear energy economically viable --- competition with coal 13 p0045 A77-12933

The potential for application of energy storage capacity on electric utility systems in the United States. I 13 p0054 A77-15625

Electric energy from atmospheric water vapor 13 p0077 A77-19097

Heating a building by means of solar and electrical energy 13 p0078 A77-19113

The energy situation in Canada 14 p0165 A77-23307

The dilemma of future electric power demand 14 p0167 A77-23391

Electricity and the energy 'gap' 14 p0195 A77-27890

Energy considerations related to the acquisition, supply, and utilization of solar energy 14 p0203 A77-29572

Equivalence of electricity and fuels - Contributing elements to a critical discussion 15 p0263 A77-31573

Simple thermal decomposition reactions for storage of solar thermal energy 15 p0292 A77-35153

The question of the utilization of geothermal energy in dry rocks /dry walls/ 15 p0303 A77-36348

Comparative energy policies of France, England, and Germany. II - Electricity and nuclear energy 15 p0324 A77-39505

The future of solar-thermal small-scale power stations 15 p0336 A77-39981

Types of city development, energy supply, and possibilities for optimization 15 p0338 A77-40349

The interaction of batteries and fuel cells with electrical distribution systems - Line commutated converter interface 16 p0414 A77-42634

Conceptual design of underground compressed air storage electric power systems 16 p0451 A77-48770

A hydrogen-halogen energy storage system for electric utility applications 16 p0457 A77-48818

Optimum operating conditions for a cylindrical parabolic focusing collector/Rankine power generation cycle system 16 p0468 A77-48905

Using Salton Sea Geothermal brines for electrical power: A review of progress in chemistry and materials technology - 1976 Status 16 p0469 A77-48908

Insolation and temperature statistics and their influence on the design of solar heating systems and the electric utility interface 16 p0479 A77-49000

A central receiver solar system applicable to central power stations 16 p0483 A77-49036

Wind-electric conversion utilizing field modulated generator systems 16 p0489 A77-49087

Synchronous inversion - Concept and application --- use of intermittent variable power sources to supplement primary sources 16 p0490 A77-49088

Wind energy statistics for large arrays of wind turbines - New England and Central U.S. regions 16 p0490 A77-49091

The application of wind power systems to the Minnesota Power and Light Company 16 p0490 A77-49092

- Electric energy supply alternatives for New York.  
Phase 2: An appraisal of electrical energy  
alternatives available to the State of New York  
[PB-249881/4] 13 p0101 N77-11575

Electrochemical power and hydrogen generation from high temperature electrolytic cells 13 p0025 A77-12709

Advances in component technology for nickel-zinc cells 13 p0025 A77-12710

Development of sodium/sulfur-cells 13 p0026 A77-12716

Sodium/sulphur battery development in the United Kingdom 13 p0026 A77-12717

Some studies on sodium/sulfur cells 13 p0055 A77-15813

Highly dispersed tungsten carbide for fuel cells with an acidic electrolyte 13 p0055 A77-15815

Fuel cell assemblies with an acidic electrolyte 13 p0055 A77-15816

Investigation of a TiO<sub>2</sub>/electrolyte solar cell and the photocatalytic water decomposition 13 p0077 A77-19094

Sodium/sulphur battery design and development for motive power applications 14 p0161 A77-22905

The lithium-water-air battery for automotive propulsion 14 p0162 A77-22915

Oxygen accumulation and electrolyte loss in nickel hydrogen cells 14 p0195 A77-28157

Semiconductor-electrolyte photovoltaic cells employing CdSe and CdTe 15 p0259 A77-30742

Hydrogen production plants using electrolytic cells with low cost electrodes built into pressure tanks 15 p0278 A77-33365

Photoelectronic properties of CdTe-electrolyte heterojunctions - Feasibility as solar energy converters 15 p0320 A77-38330

Solar conversion efficiency of pressure sintered cadmium selenide liquid junction cells 15 p0320 A77-38367

A new design for the high-performance sodium-sulfur battery [SAE PAPER 770281] 16 p0424 A77-44564

Rechargeability studies of ambient temperature lithium/sulfur batteries 16 p0447 A77-48729

The storability of Li/SO<sub>2</sub> cells 16 p0447 A77-48730

ERDA Fuel Cell Applied Research Program 16 p0447 A77-48736

Post-test analysis of Li/Pes<sub>2</sub> compact cells 16 p0448 A77-48739

Development status of lithium-silicon/iron sulfide load leveling batteries 16 p0448 A77-48741

New separators for nickel-zinc batteries  
[NASA-TM-X-3465] 13 p0121 N77-14585

Recent developments of large electrolytic hydrogen  
generators 14 p0238 N77-21592

Development of a low capital cost electrolyzer 14 p0239 N77-21596

Hydrogen production plants using electrolytic  
cells with low cost electrodes built into  
pressure tanks 14 p0239 N77-21599

Optimization of platinum-doped Kocite electrodes in  
H<sub>3</sub>PO<sub>4</sub> fuel cells [AD-A039242] 16 p0529 N77-30626

**ELECTROLYTIC POLARIZATION**

Near-uv photon efficiency in a TiO<sub>2</sub> electrode -  
Application to hydrogen production from solar  
energy 13 p0015 A77-11947

**ELECTROMAGNETIC FIELDS**

Analogy between thermal-convective and  
magnetohydrodynamic instabilities 16 p0425 A77-44690

**ELECTROMAGNETIC INTERFERENCE**

Photovoltaic system test facility electromagnetic  
interference measurements [NASA-TM-X-73640] 15 p0343 N77-22608

**ELECTROMAGNETIC MEASUREMENT**

Remote sensing of an underground coal-burn cavity  
with a wide-band induction system 13 p0007 A77-11050

**ELECTROMAGNETIC PROPULSION**

Mass driver retrievals of earth-approaching  
asteroids --- earth orbit capture for mining  
purposes [AIAA PAPER 77-528] 15 p0265 A77-32053

**ELECTROMAGNETIC RADIATION**

Monitoring fluid flow by using high-frequency  
electromagnetic probing [UCRL-51579] 13 p0120 N77-14393

Theoretical analysis of the EREC report  
[NASA-CR-152542] 15 p0390 N77-27493

**ELECTROMAGNETS**

A large conventional MHD magnet 16 p0503 A77-50433

**ELECTROMECHANICAL DEVICES**

Performance of an electric van fitted with a  
hydrodynamic torque converter transmission 14 p0160 A77-22897

High-power systems with ac generators and inertial  
storage tanks for electrophysical devices 15 p0261 A77-31426

Electrochemical energy conversion. I - Electric  
vehicle propulsion 15 p0303 A77-36410

Electromechanical stabilization system 16 p0511 N77-28211

**ELECTROMECHANICS**

A possible correlation of the neutron yield to the  
electromechanic work in Mather-type plasma focus  
devices 13 p0061 A77-17017

**ELECTROMOTIVE FORCES**

Thermoelectric power of pseudoternary solid  
solutions 13 p0014 A77-11917

**ELECTRON ACCELERATORS**

Electron beam research at Sandia Laboratories, USA  
--- for inertial confinement fusion 14 p0138 A77-20706

**ELECTRON BEAMS**

Electron beam research at Sandia Laboratories, USA  
--- for inertial confinement fusion 14 p0138 A77-20706

A microwave energy converter with a reversing  
magnetic field 14 p0139 A77-21154

Overview of energy research and development  
administration inertial confinement fusion program 14 p0146 A77-21744

Silicon solar cells by high-speed low-temperature  
processing 15 p0258 A77-30728

Electron beam heated sciencid reactors for fusion  
power and fissile fuel breedings 16 p0459 A77-48827

The 120-keV beam direct conversion system for FTR  
injectors [UCRL-52137] 15 p0355 N77-23610

**ELECTRON DENSITY (CONCENTRATION)**

Electron concentration measurements in combustion  
MHD flows by submillimeter laser interferometry 16 p0425 A77-44821

**ELECTRON DENSITY PROFILES**

Boundary layer measurements of temperature and  
electron number density profiles in a combustion  
MHD generator 15 p0288 A77-33710

**ELECTRON DIFFUSION**

Response of a partially illuminated solar cell 14 p0139 A77-21025

Increase of diffusion lengths of minority carriers  
under the effect of a width gradient of the  
forbidden band 14 p0151 A77-21823

Analysis of silicon solar cells with stripe  
geometry junctions 14 p0156 A77-22079

Photovoltaic properties and junction formation in  
CuInSe<sub>2</sub> 15 p0305 A77-36584

**ELECTRON EMISSION**

Thermonic emission characteristics of seeded coal  
slags 14 p0140 A77-21229

**ELECTRON ENERGY**

Construction of two-dimensional steady-state  
solution of equations of a nonequilibrium  
magnetized plasma 13 p0065 A77-18130

On the construction of plane stationary solutions  
of equations for nonequilibrium magnetized plasma 16 p0420 A77-43705

Status of research on advanced thermonic converters 16 p0466 A77-48889

**ELECTRON IRRADIATION**

Radiation effects on high efficiency silicon solar  
cells 13 p0064 A77-18072

Radiation effects on high efficiency silicon solar  
cells --- for spacecraft application 16 p0416 A77-42892

**ELECTRON MICROSCOPES**

Epitaxial silicon technology for low-cost solar  
cells [PB-262396/5] 15 p0374 N77-25663

**ELECTRON OSCILLATIONS**

Methods of 'tailoring' ion distributions in phase  
space /'morphodynamics'/ --- in Migma-type  
fusion reactors 16 p0436 A77-47364

**ELECTRON PARAMAGNETIC RESONANCE**

Hydrogen atoms: Rare earth ions: Magnetic  
resonance studies on polycrystalline solids and  
surface systems relevant to catalysis and other  
energy-related research 13 p0117 N77-13798

**ELECTRON PLASMA**

Status of research on advanced thermonic converters 16 p0466 A77-48889

**ELECTRON RECOMBINATION**

Response of a partially illuminated solar cell 14 p0139 A77-21025

Fundamental electronic mechanisms limiting the  
performance of solar cells 15 p0257 A77-30710

**ELECTRON SPECTROSCOPY**

Thermonic converter performance with oxide  
collectors 16 p0466 A77-48888

**ELECTRON TRANSFER**

Biological solar energy conversion: Approaches to  
overcome yield, stability and product limitations  
[PB-267937/1] 16 p0554 N77-33619

**ELECTRON TRANSITIONS**

Measurements of Sc I gf-values --- absorption  
spectroscopy using heat pipe oven 13 p0058 A77-16270

**ELECTRONIC CONTROL**

Bosch technical instruction. Gasoline injection D  
and L-jetronic [NASA-TT-P-17111] 13 p0095 N77-11399

**ELECTRONIC EQUIPMENT**

Cooling arrays of circuit cards using heat pipes  
and forced air diffusers 13 p0031 A77-12766

## SUBJECT INDEX

## ENERGY BANDS

- ELECTRONIC MODULES**  
Use of heat pipes in electronic hardware  
16 p0526 N77-30293
- ELECTROPHORESIS**  
Charge characteristics of particles in coal  
derived liquids - Measurement and origin  
16 p0412 A77-42408
- ELECTROPHOTOMETRY**  
Experimental facility for measuring spatial and  
energy characteristics of solar concentrators  
14 p0179 A77-25356  
Experimental setup for measuring space and energy  
characteristics of solar concentrators  
16 p04C9 A77-41906
- ELECTROPLATING**  
Disposal of toxic wastes. I - Electroplating and  
electrochemical machining wastes. II - Poisonous  
and radioactive wastes  
15 p0305 A77-36608
- ELECTROSTATIC CHARGE**  
Electrostatic energy storage  
[ORNL-TN-5529]  
15 p0364 N77-24598
- ELECTROSTATIC PRECIPITATORS**  
Energy reduction in cleaning exhausts containing  
particulates and noxious gases  
16 p0414 A77-42740  
Electrostatic precipitator design for western coals  
16 p0504 A77-51148  
Air pollution control for industrial coal-fired  
boilers  
16 p0504 A77-51152
- ELECTROSTATICS**  
Electrostatic properties of JP-5 jet fuel from  
alternate sources  
[AD-A025684]  
13 p0103 N77-12232
- ELLIPSONETERS**  
Ellipsometry in the study of selective  
radiation-absorbing surfaces --- for solar energy  
16 p0406 A77-41581
- EMERGENCIES**  
Emergency power plant of rapid availability for  
the Berlin-Tegel airport  
13 p0001 A77-10324  
Proposed energy conservation contingency plan:  
Emergency heating, cooling and hot water  
restrictions. Economic impact analysis.  
Environmental impact assessment  
[PB-258624/6]  
14 p0217 N77-18584
- EMITTANCE**  
Study of emittance distribution along the walls of  
a cellular low-loss cell in the case of a base  
surface with arbitrary emission indicatrix  
13 p0069 A77-18495
- ENCAPSULATING**  
Encapsulation of solar cell modules  
13 p0076 A77-19092  
Consideration of encapsulants for photovoltaic  
arrays in terrestrial applications  
14 p0203 A77-29580  
Review of world experience and properties of  
materials for encapsulation of terrestrial  
photovoltaic arrays  
[NASA-CR-149451]  
13 p0106 N77-12524  
Solar energy subsystems employing isothermal heat  
sink materials  
[PB-258738/4]  
14 p0233 N77-20616  
Investigation of test methods, material properties  
and processes for solar cell encapsulants  
[NASA-CR-155158]  
16 p0550 N77-33347
- ENERGY**  
Environmental considerations of selected energy  
conserving manufacturing process options.  
Volume 13: Phosphoric acid industry report  
[PB-264279/1]  
15 p0385 N77-26690
- ENERGY ABSORPTION**  
Progress in development and application of  
selective surfaces --- for solar collectors  
13 p0072 A77-19052  
Temperature optimization for power production of  
infinite heat transfer solar absorbers  
13 p0073 A77-19055  
Absorption cycles for air-cooled solar air  
conditioning  
14 p0168 A77-23447  
Study of an absorption solar refrigeration unit  
functioning on a round-the-clock basis  
15 p0316 A77-37772
- Investigation of solar absorption cooler for  
round-the-clock operation  
16 p0437 A77-47428  
Parametric study of a dynamic solar powered  
absorption cycle  
16 p0475 A77-48961
- ENERGY ABSORPTION FILMS**  
Plastics for solar-energy collectors. II - Typical  
operational data and model parameters,  
functional diagrams, optimization of layer  
thicknesses  
13 p0009 A77-11269  
Photovoltaic conversion of solar energy  
13 p0058 A77-16368  
Contribution to the study of solar energy  
collectors - Selective plates and cells  
13 p0072 A77-19051  
Indoor test methods to determine the effect of  
vacuum on the performance of a tubular flat  
plate collector --- for solar energy conversion  
[ASME PAPER 76-WA/SOL-24]  
14 p0190 A77-26529  
Plastics in systems of solar technology - A survey  
14 p0197 A77-28677  
The selectivity of absorbing layers --- of solar  
collector materials  
14 p0202 A77-29565  
Wavelength-selective surfaces for solar energy  
utilization  
14 p0204 A77-29583  
A comparison of solar photothermal coatings  
14 p0204 A77-29584  
Improved black nickel coatings for flat plate  
solar collectors  
14 p0204 A77-29585  
Applications of thin graded-index films to solar  
absorbers  
15 p0260 A77-31244  
Selective black absorbers using RF-sputtered  
Cr2O3/Cr cermet films  
15 p0265 A77-31951  
Novel development for economic solar-energy  
utilization  
15 p0268 A77-32402  
Spectral reflectance of TiN/x/ and ZrN/x/ films as  
selective solar absorbers  
16 p0423 A77-44492  
The Alcoa 655 selective surface for aluminum ---  
for solar collectors  
16 p0487 A77-49063  
Analytical and experimental treatment of a  
spray-on selective coating - Application to  
collector design  
16 p0487 A77-49064  
Solar energy utilization, solid state science, and  
a high efficiency amorphous-silicon absorber  
16 p0487 A77-49065  
The financial incentives for the fabrication of  
improved absorption coatings for the flat plate  
collector  
16 p0487 A77-49066  
Considerations in the development of a high  
performance per unit cost solar collector  
16 p0487 A77-49067  
Use of getters in evacuated solar collectors  
16 p0487 A77-49069  
The weatherability of solar energy utilization  
materials - Preliminary discussions  
16 p0487 A77-49070  
Heat mirror - A practical alternative to the  
selective absorber  
16 p0488 A77-49075  
Fundamental studies of black chrome for solar  
collector use  
16 p0498 A77-49160  
Cadmium stannate selective optical films for solar  
energy applications  
[PB-254879/0]  
13 p0090 N77-10678  
Development of a new silicon Schottky photovoltaic  
energy converter  
[PB-262491/4]  
15 p0373 N77-25654
- ENERGY BANDS**  
Fundamental electronic mechanisms limiting the  
performance of solar cells  
15 p0257 A77-30710  
Upper limit of efficiency for photovoltaic solar  
cells  
16 p0399 A77-40568

# ENERGY BUDGETS

# SUBJECT INDEX

## ENERGY BUDGETS

Characteristic aspects of the evolution of the French electric balance in 1975 13 p0012 A77-11340

Solar energy as contribution to the energy budget - Problems of storage 15 p0336 A77-39986

Energy budget for the year-round solar collector/storage system of a housing cluster situated in northern France 16 p0417 A77-42963

Predicting the rate of warming of rivers below hydroelectric installations 16 p0437 A77-47749

## ENERGY CONSERVATION

The energy problem and the earth's fuel situation 13 p0004 A77-11027

Energy consumption and conservation in the United States 13 p0005 A77-11028

Total energy systems --- electric power generation with heat recovery 13 p0006 A77-11042

Optimal thermal insulation as an investment-computational problem 13 p0009 A77-11268

Air cleanup and energy management 13 p0010 A77-11302

Electricity and heat production - Energy efficiency versus cost efficiency 13 p0011 A77-11338

Nuclear power, coal and energy conservation /with a note on the costs of a nuclear moratorium/ 13 p0013 A77-11524

Air transportation energy efficiency - Alternatives and implications [SAWE PAPER 1124] 13 p0016 A77-12192

Baseline test data for the EVA electric vehicle --- low energy consumption automobiles 13 p0025 A77-12704

Energy saving potential of engine-electric vehicular drives 13 p0025 A77-12708

Energy conservation with advanced power generating systems 13 p0026 A77-12723

Energy conservation potential of Modular Integrater Utility Systems /MIUS/ 13 p0026 A77-12724

Diversification as an energy conservation strategy 13 p0027 A77-12725

Industrial energy conservation through integration of thermal energy storage into process energy dynamics 13 p0028 A77-12733

An advanced energy conservation technology program; Proceedings of the Intersociety Workshop Conference, Airlie House, Va., March 24-26, 1976 13 p0045 A77-12928

Evolution of the concept of the automobile from the standpoint of saving energy 13 p0051 A77-14562

Energy recovery in railway and road transportation 13 p0051 A77-14564

Energy and environmental impacts of materials alternatives - An assessment of quantitative understanding 13 p0070 A77-18738

Improved use of energy --- through waste and solar energy utilization 13 p0079 A77-19123

Commuter van programs - An assessment 14 p0137 A77-20391

Electric load management and energy conservation 14 p0137 A77-20685

Energy - An emerging role for aerospace 14 p0166 A77-23363

New requirements for the development and design of thermal power systems 14 p0167 A77-23407

Solar energy retrofit for existing buildings 14 p0168 A77-23444

The potential for fuel conservation 14 p0178 A77-24960

Basis for developing a solar energy inventory 14 p0179 A77-25360

Electricity and the energy 'gap' 14 p0195 A77-27890

New life for old garbage - Resource and energy recovery from solid wastes 14 p0199 A77-29096

Application of gravitational energy exchange to tracked urban transit systems 14 p0200 A77-29468

Optimal unit commitment --- electric power system operating mode for cost reduction 15 p0260 A77-30812

The law for saving energy and its significance for energy politics 15 p0261 A77-31312

Energy savings by application of knowledge of building physics. I - Wall permeability and its significance for the atmospheric conditions in the building interior, the design and the thermal characteristics of windows, problems concerning the permeability of the joints 15 p0261 A77-31373

Economy of tap water heating in summer by means of solar energy 15 p0261 A77-31374

Efficient energy utilization 15 p0264 A77-31578

Ways of improving fuel utilization in industry 15 p0265 A77-31935

Industry can save energy without stunting its growth 15 p0267 A77-32209

Energy from wastes 15 p0272 A77-33280

Automotive fuel-saving system with on-board hydrogen generation and injection into I. C. engines 15 p0280 A77-33384

Cut energy costs: A guide for buying and plant operation --- industrial energy saving techniques 15 p0290 A77-34642

Energy and aerospace /Sixty-fifth Wilbur and Orville Wright Memorial Lecture/ --- aerospace contributions to energy conservation 15 p0304 A77-36434

Energy research overview - Alternatives for energy development [AAS 75-280] 15 p0304 A77-36555

Energy conservation and a healthy economy 15 p0305 A77-36612

Technologies lead to conservation --- in munition plants 15 p0305 A77-36634

Economic benefits of energy conservation 15 p0307 A77-36797

The auto option --- bus usage in urban areas 15 p0310 A77-36983

Running out of steam. III --- alternatives to internal combustion engine 15 p0310 A77-36984

Municipal solid waste as a resource for energy recovery and conservation 15 p0313 A77-37655

Thermolysis or electrolysis - Why we choose the latter --- water splitting for hydrogen production 15 p0321 A77-38528

Energy conservation in the investment policies of French firms. I - Formulation of the problem 15 p0324 A77-39504

Comparative energy policies of France, England, and Germany. II - Electricity and nuclear energy 15 p0324 A77-39505

Technical and economic aspects of industrial power-heat coupling. I 15 p0334 A77-39674

The NASA Energy Conservation Program [AIAA PAPER 77-1005] 16 p0405 A77-41571

Energy conservation by symbiosis 16 p0408 A77-41852

Fundamentals of solar-energy survey development 16 p0409 A77-41910

Thermal storage - It saves and saves and saves --- energy conservation 16 p0415 A77-42741

Evaluation of energy policy 16 p0415 A77-42859

Future energy options, ethics and a case for conservation 16 p0415 A77-42860

The heat pump - An approach for saving energy 16 p0421 A77-44450

Fuel conservation through airplane maintenance 16 p0427 A77-45925

## SUBJECT INDEX

## ENERGY CONSERVATION CONTD

- Energy savings obtained by applying the findings of construction physics. II 16 p0441 A77-48259
- Comparing alternative methods of improving fuel economy --- in automobiles 16 p0443 A77-48702
- Utilizing methane from coalbeds 16 p0444 A77-48710
- ERDA fuel cell programs 16 p0447 A77-48734
- Energy and economic effects of residential energy conservation programs 16 p0448 A77-48743
- Energy-efficient desiccant drying/dehumidification using solar or fossil fuel energy 16 p0449 A77-48750
- Feasibility study of an Integrated Energy/Utility System at the University of Florida 16 p0449 A77-48751
- Energy savings through on-site fuel cells in industrial applications 16 p0449 A77-48752
- Heat pipes for hostile environments in energy conservation applications 16 p0450 A77-48758
- Improved systems for energy conversion and conservation as pollution control alternatives - USEPA program 16 p0451 A77-48771
- Fluidized-bed combustion of anthracite refuse 16 p0454 A77-48793
- Energy conversion and storage by CDE /concentration difference energy/ engine and system 16 p0459 A77-48831
- Solar heating for buildings in Ontario - Experience and analysis of single, multiple residential and commercial low rise buildings 16 p0476 A77-48975
- Energy conservation through residential solar retrofit 16 p0479 A77-48994
- A parametric study of critical fuel costs for solar heating in North America 16 p0493 A77-49118
- Approaches leading to an efficient use of energy, illustrated with the aid of examples concerning the rail traffic and low-temperature heat requirements 16 p0504 A77-51153
- Transportation energy conservation data book [ORNL-5198] 13 p0086 N77-10643
- Analysis of state solar energy options [PB-254730/5] 13 p0091 N77-10688
- Aircraft fuel conservation technology. Task force report, September 10, 1975 [NASA-TM-X-74295] 13 p0093 N77-11055
- Conference report: Energy Conservation in Transportation and Construction [PB-255657/5] 13 p0100 N77-11562
- Assessing the relationship between urban form and travel requirements: A literature review and conceptual framework [PB-254588/9] 13 p0102 N77-11923
- California energy outlook [UCRL-5196-REV-1] 13 p0106 N77-12525
- A study of inplant electric power generation in the chemical, petroleum refining, and paper and pulp industries [PB-255658/7] 13 p0115 N77-13542
- A study of inplant electric power generation in the chemical, petroleum refining, and paper and pulp industries [PB-255659/5] 13 p0115 N77-13543
- Bonneville power administration electric energy conservation study [PB-256766/7] 13 p0115 N77-13550
- Final assessment of the environmental impacts of the State Energy Conservation Program (Public law 94-163, Title III, part C, The Energy Policy and Conservation Act) [PB-256044/9] 13 p0116 N77-13555
- Research plan for achieving reduced automotive energy consumption [PB-255929/2] 13 p0121 N77-14495

# SUBJECT INDEX

# ENERGY POLICY CONTD

Energy prospects in the Netherlands 15 p0307 A77-36801

Energy technology assessment - Considerations of geographical scale 15 p0309 A77-36822

North Slope oil and United States energy supply 15 p0309 A77-36823

The Wisconsin Regional Energy project - An applied systems analysis approach to regional energy/environment modeling 15 p0309 A77-36825

EPA's program in environmental research in wastes-as-fuel 15 p0315 A77-37668

Energy R&D modeling for budgetary decisions 15 p0319 A77-38218

The Energy Supply Planning Model - A working tool for regional analysis of alternative national energy policies 15 p0319 A77-38221

Energy conservation in the investment policies of French firms. I - Formulation of the problem 15 p0324 A77-39504

Comparative energy policies of France, England, and Germany. II - Electricity and nuclear energy 15 p0324 A77-39505

Alternatives to oil and gas through energy management [AIAA 77-1006] 16 p0403 A77-41553

Have energy, will travel --- alternative aviation energy sources in the future 16 p0409 A77-41933

The impact of the energy crisis on the demand for fuel efficiency - The case of general aviation 16 p0410 A77-42038

Economic aspects of U.S. energy independence in the coming decade 16 p0411 A77-42165

Methodological questions concerning the evaluation of the economic potential of energy resources 16 p0412 A77-42262

Creating a welcome for aerospace energy technology 16 p0413 A77-42561

Putting alternative sources of energy into prospective 16 p0414 A77-42633

Environmental Pollution Symposium on Practical Alternatives to Present Urban Life, 5th, Menlo Park, Calif., May 12, 13, 1976, Proceedings 16 p0415 A77-42854

The United States energy dilemma - How can we solve it 16 p0415 A77-42855

Patterns of energy use and the critical choices ahead 16 p0415 A77-42856

Some impacts of restricting nuclear energy availability 16 p0415 A77-42857

Evaluation of energy policy 16 p0415 A77-42859

Future energy options, ethics and a case for conservation 16 p0415 A77-42860

A two-stage forecasting methodology for developing a national energy policy 16 p0419 A77-43144

Energy supply of the Federal Republic of Germany 16 p0419 A77-43566

Introduction to the ERDA electric and hybrid demonstration program --- electric and hybrid vehicle research and development 16 p0420 A77-43675

Electric vehicles - A major potential contribution to solution of U.S. energy problems 16 p0420 A77-44060

What's holding up coal gasification 16 p0423 A77-44522

Global problems and energy 16 p0425 A77-44688

The utilization of solar energy in Central Europe 16 p0426 A77-45461

Closed costs of electrical energy for different zones of load graphs of electrical energy systems 16 p0437 A77-47751

Energy and economic effects of residential energy conservation programs 16 p0448 A77-48743

Sharing the sun: Solar technology in the seventies; Proceedings of the Joint Conference, Winnipeg, Canada, August 15-20, 1976. Volumes 1-10 16 p0469 A77-48910

Overview of Canadian activities in renewable energy resources 16 p0469 A77-48912

Solar residential demonstration program 16 p0469 A77-48914

The United States National Program for the demonstration of solar heating and cooling in buildings - Progress report 16 p0470 A77-48918

Some legal-institutional implications of offshore wind energy conversion systems 16 p0489 A77-49086

Solar energy and urban settlements 16 p0494 A77-49127

Report on United States international cooperation in solar energy technology development 16 p0495 A77-49132

Commercialization of solar heating and cooling of buildings 16 p0496 A77-49142

High-efficiency solar concentrator 13 p0083 N77-10104

The potential and economics of enhanced oil recovery [PB-254991/3] 13 p0086 N77-10633

Transportation energy conservation data book [ORNL-5198] 13 p0086 N77-10643

Utilization of geothermal energy [UTIAS-REVIEW-40] 13 p0087 N77-10644

Creating energy choices for the future. Public meeting on A National Plan for Energy Research, Development, and Demonstration [CONF-751228-P2] 13 p0087 N77-10646

Creating energy choices for the future [CONF-751228-P1] 13 p0087 N77-10647

Prospects for hydrogen production by water electrolysis to be competitive with conventional methods [BNL-20877] 13 p0087 N77-10648

Advanced coal gasification system for electric power generation --- pollution monitoring [FE-1514-176] 13 p0088 N77-10653

Waste heat vs conventional systems for greenhouse environmental control: An economic assessment [ORNL-TM-5069] 13 p0088 N77-10656

Energy fact book 1975. Parts 1-5: Appendixes A-H [AD-A023010] 13 p0089 N77-10664

Energy: The policy planning framework in state governments. Volume 1: Summary report [PB-254466/6] 13 p0089 N77-10665

Energy: The policy planning framework in state governments. Volume 2: Appendices [PB-254467/4] 13 p0089 N77-10666

Summary of EPA energy policy analysis [PB-253361/0] 13 p0089 N77-10669

Gasoline and distillate shortage situation: 1972-1976 [PB-253322/2] 13 p0089 N77-10670

Analysis of state solar energy options [PB-254730/5] 13 p0091 N77-10688

Baseline energy forecasts and analysis of alternative strategies for airline fuel conservation [PB-255351/9] 13 p0091 N77-10690

Mandatory Canadian crude oil allocation regulations [PB-255319/6] 13 p0096 N77-11509

Identification and analysis of mid-Atlantic onshore OCS impact [PB-254925/1] 13 p0096 N77-11516

Multi-year time frame optimization of power systems with fossil, nuclear, hydro, pumped storage and peaking units 13 p0096 N77-11525

National program for solar heating and cooling (residential and commercial applications) [ERDA-23A] 13 p0098 N77-11540

Mathematics for energy [PB-252463/5] 13 p0098 N77-11543

Energy information activities at the FEA [PB-253962/5] 13 p0099 N77-11553

Societal implications of energy scarcity. Social and technological priorities in steady state and constricting systems [PB-253097/0] 13 p0099 N77-11556

- Summary of cost and quality of electric utility plant fuels, 1976 [PB-267368/9] 16 p0543 N77-32335
- Solar photolysis of water [NASA-CASE-NPO-13675-1] 16 p0544 N77-32580

# SUBJECT INDEX

# ENERGY REQUIREMENTS

An initial comparative assessment of orbital and terrestrial central power systems  
[NASA-CR-155042] 16 p0546 N77-32594

Workshop to Review FEA's 1976 National energy outlook  
[PB-268149/2] 16 p0547 N77-32601

Study of electric and gas utilities and the public service commission of Nevada  
[PB-268481/9] 16 p0547 N77-32605

Improving regulatory effectiveness in Federal/State siting actions. Alternative financing methods  
[PB-269390/1] 16 p0547 N77-32606

Energy management for Texas commerce and industry  
[PB-268409/0] 16 p0548 N77-32616

National energy projections and plans of the USA  
[IAEA-CN-36/397] 16 p0548 N77-32619

Analysis and forecast of electrical distribution system materials. Volume 3: Appendix  
[CONS/2050-1-VOL-3-APP] 16 p0551 N77-33430

The President's energy program  
[GPO-88-556] 16 p0552 N77-33599

Review of electrochemical impregnation for nickel cadmium cells --- aerospace applications  
[NASA-CR-155155] 16 p0552 N77-33601

Solid polymer electrolyte (SPE) fuel cell technology program, phase 1/1A --- design and fabrication  
[NASA-CR-151506] 16 p0553 N77-33605

Solid polymer electrolyte (SPE) fuel cell technology program, phase 2/2A --- testing and evaluations  
[NASA-CR-151507] 16 p0553 N77-33606

Europe's changing energy relations  
[R-2086-ISA] 16 p0553 N77-33610

An approach for managing an energy conservation program  
[AD-A041086] 16 p0554 N77-33614

DoD energy R And D. Part 2: Military fuel operations. Performance and R and D implications  
[AD-A042272] 16 p0554 N77-33617

Sandia Laboratories energy programs  
[SAND-77-0034] 16 p0555 N77-33629

Design and cost study of a zinc/nickel oxide battery for electric vehicle propulsion  
[ANL-K-76-3543-1] 16 p0556 N77-33635

Analysis of the California energy industry  
[LBI-5928] 16 p0557 N77-33640

Accounting systems for energy conservation  
[LA-6569-MS] 16 p0557 N77-33646

Program plan for ERDA's participation in the IEA working party on energy conservation research and development  
[ERDA-77-57] 16 p0557 N77-33648

Solar radiation availability for New Mexico  
[SAND-77-0004] 16 p0558 N77-33654

Ecological considerations of the solar alternatives  
[LBI-5927] 16 p0558 N77-33655

Solar collector manufacturing activity  
[PB-266985/1] 16 p0558 N77-33664

Window design strategies to conserve energy  
[PB-269257/8] 16 p0559 N77-33669

Energy policy decisionmaking, organization, and national energy goals  
[PB-269299/4] 16 p0559 N77-33671

Public participation in energy related decision making, edited transcripts  
[PB-268781/2] 16 p0559 N77-33674

Energy interrelationships. A handbook of tables and conversions factors for combining and comparing international energy data  
[PB-269034/5] 16 p0559 N77-33675

Role of nuclear power in meeting future U.S. energy needs  
[IAEA-CN-36/396] 16 p0560 N77-33677

Energy options open to mankind beyond the turn of the century  
[IAEA-CN-36/538] 16 p0560 N77-33679

Survey of nuclear fuel cycle economics: 1970 - 1985  
[ORNL-TM-5703] 16 p0561 N77-33968

**ENERGY REQUIREMENTS**

Energy use in industry 13 p0005 A77-11029

Energy and the coal industry 13 p0005 A77-11030

Energy and the oil industry 13 p0005 A77-11031

Energy and the gas industry 13 p0005 A77-11032

Energy and the developing countries 13 p0006 A77-11043

Methods of energy analysis 43 p0007 A77-11046

Energy analysis in modelling 13 p0007 A77-11047

The overcoming of energy deficiencies with the aid of wind power 13 p0008 A77-11174

The wind and its effect on the heating requirements 13 p0009 A77-11266

Energy in the household - Comparison of heating costs and prognosis concerning the consumption of energy until 1985 13 p0015 A77-12059

A methodical approach concerning energy supply problems 13 p0016 A77-12062

The long-range prospects for solar energy 13 p0017 A77-12237

Load leveling with electric vehicles in the urban environment 13 p0024 A77-12701

Modeling residential energy use 13 p0027 A77-12726

The pressure divider - A device for reducing gas-pipe-line pumping-energy requirements 13 p0028 A77-12735

Economic and engineering implications of the Project Independence 1985 geothermal energy output goal and the associated sensitivity analysis 13 p0029 A77-12745

Benefits of hydrogen production research 13 p0032 A77-12768

Power source requirements of electric propulsion systems used for north-south stationkeeping of communication satellites 13 p0040 A77-12833

Energy and environment post-2000 13 p0050 A77-14560

Perspectives for world energy production 13 p0056 A77-16202

Electric power supply in the case of airports. I 13 p0061 A77-16742

The future importance of solar energy for the supply of the German Federal Republic with energy 13 p0070 A77-18597

Hydel and solar power for Pakistan --- hydroelectric power 13 p0079 A77-19121

Demand electric rates - A new problem and challenge for solar heating 14 p0137 A77-20388

Worldwide energy development - Delayed opportunities 14 p0147 A77-21762

Effect of the characteristics of electrical supply networks on the design of solar power plants 14 p0155 A77-21858

The computer simulation of automobile use patterns for defining battery requirements for electric cars 14 p0159 A77-22879

The energy situation in Canada 14 p0165 A77-23307

Pumped-storage electric power generating plants 14 p0166 A77-23373

Can new resources fill the energy gap 14 p0166 A77-23380

The dilemma of future electric power demand 14 p0167 A77-23391

The potential for fuel conservation 14 p0178 A77-24960

Our energy future: The role of research, development, and demonstration in reaching a national consensus on energy supply --- Book 14 p0179 A77-25224

Net energy analyses for liquid-dominated and vapor-dominated hydrothermal energy-resource developments 14 p0194 A77-27351

Parametric studies of applications of controlled thermonuclear reactor fusion energy for food production 14 p0194 A77-27356

Current problems in energy development and energy sciences 14 p0194 A77-27882

- The application of linear programming methods to the problem of choosing required reserves of energy for controlled plants 14 p0196 A77-28255
- Place and role of various energy resources in energetics of the future 15 p0261 A77-31468
- Energy-turn-rate characteristics and turn performance of an aircraft 15 p0265 A77-31855
- Role of the nuclear energy system in the total fuel-energy picture in the USSR 15 p0267 A77-32220
- A simplified equilibrium model of the U.S. energy-economic system and its use in comparing alternatives 15 p0285 A77-33421
- Contribution to the solution of planning problems in electric power generation /effects of random disturbances/ 15 p0294 A77-35399
- Near-term chemically-propelled space transport systems --- to space colonies 15 p0295 A77-35810
- Energy prospects in the Netherlands 15 p0307 A77-36801
- Overview of energy supply and demand 15 p0313 A77-37653
- International energy demand model - Twenty OECD country models 15 p0318 A77-38215
- A derived demand model of energy demand in the transportation sector 15 p0319 A77-38217
- A United States energy model economically driven by a global growth simulation 15 p0319 A77-38220
- Economic and energy considerations in MHD seed regeneration --- for sulfur oxides removal in coal-fired power plants 15 p0332 A77-39574
- The significance of nuclear energy for satisfying future energy requirements 15 p0333 A77-39649
- Types of city development, energy supply, and possibilities for optimization 15 p0338 A77-40349
- Energy forecasts yesterday and today 16 p0400 A77-40683
- The possibility of using regression models for calculating the effect of weather conditions on electric energy demand 16 p0411 A77-42259
- The United States energy dilemma - How can we solve it 16 p0415 A77-42855
- Patterns of energy use and the critical choices ahead 16 p0415 A77-42856
- Global problems and energy 16 p0425 A77-44688
- Geography of energy production in France. V - The markets of consumption: The Paris region and the Lyon, Strasbourg and Rennes areas 16 p0427 A77-45712
- Energy supply to the year 2000: Global and national studies --- Book 16 p0428 A77-46093
- Energy demand studies: Major consuming countries. Analyses of 1972 demand and projections of 1985 demand --- Book 16 p0428 A77-46094
- Solar energy and the residence - Some systems aspects 16 p0502 A77-50213
- Approaches leading to an efficient use of energy, illustrated with the aid of examples concerning the rail traffic and low-temperature heat requirements 16 p0504 A77-51153
- The contribution of nuclear technology toward the solution of energy problems [INIS-MF-1867] 13 p0100 N77-11565
- California energy outlook [UCRL-5196-REV-1] 13 p0106 N77-12525
- Review of energy forecasting methodologies and assumptions [PB-255170/3] 13 p0107 N77-12526
- Net energy from nuclear power [PB-254059/9] 13 p0107 N77-12527
- Hydrodynamic equilibrium conditions for AG(BH) main strut-pod foil system using flap incidence control [AD-A027521] 13 p0127 N77-15220
- Economic analysis of the need for advanced power sources [HEDL-SA-989] 13 p0131 N77-15509
- Neutral beam energy and power requirements for the next generation of tokamaks [ERDA-76-77] 14 p0213 N77-17883
- Net energy analysis: An energy balance study of fossil fuel resources [PB-259158/4] 14 p0225 N77-19657
- An energy management guidance scheme applicable to the interim upper stage --- for orbital transfer maneuvers [AD-A034005] 15 p0353 N77-23143
- Solar breeder: Energy payback time for silicon photovoltaic systems [NASA-CR-153060] 15 p0362 N77-24581
- Pace and grade related to the oxygen and energy requirements, and the mechanics of treadmill running 15 p0396 N77-27689
- World energy supply and demand and the future of nuclear power [IAEA-CN-36/583] 16 p0560 N77-33680
- Nuclear power aspects in an oil and coal producing country [IAEA-CN-36/175] 16 p0560 N77-33681
- ENERGY SOURCES**
- Prospects of generating power with laser-driven fusion 13 p0002 A77-10634
- Energy from solid wastes --- Book 13 p0003 A77-10698

# SUBJECT INDEX

# ENERGY SOURCES CONTD

Path of development and developmental status of the lignite high-temperature coking process in the DDR - An example of effective utilization of lignite as energy vehicle 14 p0163 A77-23096

Raw materials for energy generation in Canada 14 p0165 A77-23315

Can new resources fill the energy gap 14 p0166 A77-23380

Clean fuels from biomass 14 p0167 A77-23390

Shale oil, tar sands, and related fuel sources --- Book 14 p0169 A77-23551

Why solar energy --- advantages over fossil fuel and nuclear energy 14 p0170 A77-23654

Powersat - An astronautical energy solution 14 p0176 A77-24520

Prospects for fusion energy 14 p0178 A77-24928

Our energy future: The role of research, development, and demonstration in reaching a national consensus on energy supply --- Book 14 p0179 A77-25224

Energy from the wind 14 p0179 A77-25575

An analysis of the role of energy in solid waste utilization and disposal 14 p0182 A77-26070

Energy LA: Tackling the crisis; Proceedings of the Second Greater Los Angeles Area Energy Symposium, Los Angeles, Calif., May 19, 1976 14 p0182 A77-26076

Net energy analyses for liquid-dominated and vapor-dominated hydrothermal energy-resource developments 14 p0194 A77-27351

Current problems in energy development and energy sciences 14 p0194 A77-27882

Electricity and the energy 'gap' 14 p0195 A77-27890

Power Sources Symposium, 27th, Atlantic City, N.J., June 21-24, 1976, Proceedings 14 p0195 A77-28126

Unconventional petroleum and natural gas resources. II - Additional gas resources 14 p0198 A77-28760

Prospects for pipeline delivery of hydrogen as a fuel and as a chemical feedstock 14 p0200 A77-29437

Energy-direct-conversion in solar technology 14 p0203 A77-29574

Alternative energy sources --- Book 15 p0261 A77-31467

Place and role of various energy resources in energetics of the future 15 p0261 A77-31468

The case for alternative energy sources 15 p0262 A77-31469

Gas economy - Gas technology --- energy supply and utilization 15 p0263 A77-31576

Regenerative energy sources --- energy conversion and utilization feasibility 15 p0263 A77-31577

Potential energy: An analysis of world energy technology --- Book 15 p0264 A77-31825

Energy from the oceans - Requirements and capabilities 15 p0272 A77-33141

Municipal solid waste recovery - A public or private risk 15 p0273 A77-33299

Applied solar energy: An introduction /2nd edition/ --- Book 15 p0286 A77-33445

Studies on the energy system of Hokkaido. I - First attempt: Model-I. II - Various data and their basis. III - Simulations by Model-I 15 p0287 A77-33526

Economics of alternative energy sources 15 p0288 A77-33755

Energy recovery from low heating value industrial waste 15 p0292 A77-35160

District heating with refuse derived fuel at Wright-Patterson Air Force Base 15 p0293 A77-35164

Utilizing alternative energy sources in France 15 p0296 A77-35923

Solar energy prospects grow for US southwest 15 p0297 A77-36049

China claims lead in biogas energy supply 15 p0297 A77-36050

Economics of crude oil and natural gas - Cost of adding production 15 p0300 A77-36327

Clean energy from Alaskan coals 15 p0301 A77-36333

Regional energy availability from conversion of solid waste 15 p0304 A77-36433

Energy research overview - Alternatives for energy development [AAS 75-280] 15 p0304 A77-36555

Energy prospects in the Netherlands 15 p0307 A77-36801

Energy from humid air [AIAA PAPER 77-730] 15 p0311 A77-37253

The supply of the Federal Republic of Germany and Western Europe with energy, giving particular consideration to the oil and gas potential of the North Sea 15 p0334 A77-39673

Energy resources available to man 16 p0402 A77-41422

New options in energy technology; Proceedings of the Conference, San Francisco, Calif., August 2-4, 1977 16 p0402 A77-41551

Alternatives to oil and gas through energy management [AIAA 77-1006] 16 p0403 A77-41553

Implementation issues of wind energy --- cost analysis [AIAA 77-1025] 16 p0404 A77-41565

Study of the feasibility of exploiting the galloping phenomenon as energy source 16 p0407 A77-41722

The roles of aerospace organizations in energy development or can aerospace success bring success in energy [AIAA PAPER 77-1001] 16 p0408 A77-41855

Have energy, will travel --- alternative aviation energy sources in the future 16 p0409 A77-41933

Electric energy alternatives appraisal for New York State 16 p0413 A77-42632

Putting alternative sources of energy into prospective 16 p0414 A77-42633

An econometric analysis of energy over the next 75 years 16 p0414 A77-42637

The prospects for renewable energy sources 16 p0415 A77-42858

Conference on Portable Power Sources in India, 1st, Calcutta, India, May 27, 28, 1976, Proceedings 16 p0420 A77-44052

Energy supply to the year 2000: Global and national studies --- Book 16 p0428 A77-46093

Thermal properties of subsurface rocks in the Ukraine 16 p0443 A77-48647

Development status and environmental hazards of several candidate advanced energy systems 16 p0452 A77-48776

Present state and perspective of solar energy applications in Mexico 16 p0469 A77-48911

Recent Canadian activities in biomass 16 p0470 A77-48917

Technical and economic feasibility of Ocean Thermal Energy Conversion 16 p0481 A77-49018

Field crops as a future source of fuels and chemical feedstocks 16 p0489 A77-49080

Agricultural and forestry wastes as an energy resource 16 p0489 A77-49083

Perpetually renewable biomass prospects - A comparison of U.S. and Canadian ecosystem carrying capacities vs needs 16 p0489 A77-49084

Synchronous inversion - Concept and application --- use of intermittent variable power sources to supplement primary sources 16 p0490 A77-49088

Assuring the performance of fossil energy programs 16 p0503 A77-50499

The long-run marginal costs of energy [PB-252504/6] 13 p0085 A77-10625

Creating energy choices for the future [CONF-751228-P1] 13 p0087 A77-10647

Crude oil supply alternatives for the Northern Tier states [PB-255991/2] 13 p0107 A77-12530

Implementing coal utilization provisions of Energy Supply and Environmental Coordination Act [PB-255655/9] 13 p0109 A77-12549

Inventory of energy research and development (1973 - 1975), volume 1 [GPO-64-734-VOL-1] 13 p0113 A77-13525

Inventory of energy research and development (1973 - 1975), volume 4 [GPO-64-734-VOL-4] 13 p0113 A77-13528

Energy resources alternatives competition [COO-2698-1] 14 p0224 A77-19635

Net energy analysis: An energy balance study of fossil fuel resources [PB-259158/4] 14 p0225 A77-19657

Net energy analysis: An energy balance study of fossil fuel resources. Summary report [PB-259159/2] 14 p0225 A77-19658

First World Hydrogen Energy Conference proceedings, volume 1 14 p0237 A77-21552

Methods of on-board generation of hydrogen for vehicular use 14 p0242 A77-21617

Energy for rural development: Renewable resources and alternative technologies for developing countries [PB-260606/9] 14 p0251 A77-21716

Field-reversed mirror as a D-T power reactor [UCRL-78082] 15 p0351 A77-22967

CDIF combustor design [TID-27143] 15 p0377 A77-26393

Energy and physics [ERDA-TR-225] 15 p0386 A77-26916

Overview of MINPACK [CONF-760842-19] 15 p0356 A77-27761

Fusion. The future energy source [AEOL-10] 15 p0397 A77-27951

Production and processing of US tar sands: An environmental assessment [PB-266266/6] 16 p0513 A77-28575

Biosolar synfuels for transportation [UCRL-52208] 16 p0514 A77-28593

Projects to expand fuel sources in western states. Survey of planned or proposed coal oil shale, tar sand, uranium, and geothermal supply expansion projects, and related infrastructure, in states west of the Mississippi River (as of May 1976) [PB-265633/8] 16 p0516 A77-28614

National gas survey. Report to the federal power commission by the Supply-Technical Advisory Committee Study Subgroup on reserves and resources classifications [PB-265878/9] 16 p0519 A77-29324

Project Independence Evaluation System (PIES) documentation. Volume 15: Standard data tables for PIES [PB-265155/8] 16 p0523 A77-29629

Project Independence Evaluation System (PIES) documentation. Volume 8: Methodology for enabling the PIES oil and gas supply curves to respond to non-constant prices [PB-265086/9] 16 p0523 A77-29630

Space technology in the discovery and development of mineral and energy resources 16 p0526 A77-30289

Energy management for Texas commerce and industry [PB-268809/0] 16 p0548 A77-32616

Unconventional energy sources [PB-268301/9] 16 p0548 A77-32617

Role of fusion as a future power source [IAEA-CN-36/428] 16 p0549 A77-32895

## ENERGY STORAGE

Superflywheel energy storage and nonsynchronous AC/DC/AC electric transmission supplements power system operation 13 p0002 A77-10638

Energy storage --- quality, duration, methods and forms 13 p0006 A77-11040

Compressed air energy storage - A near term option for utility application 13 p0027 A77-12727

Underground storage of off-peak power 13 p0027 A77-12728

Storage in oil of off-peak thermal energy from large power stations 13 p0027 A77-12730

Thermal energy storage for solar power plants 13 p0027 A77-12731

Seasonal storage of thermal energy in water in the underground --- reservoirs 13 p0028 A77-12734

VBP heat pipes for energy storage --- Vapor Bubble Pumping 13 p0032 A77-12767

Energy storage via calcium hydride production 13 p0032 A77-12774

Metal hydrides of improved heat transfer characteristics 13 p0033 A77-12775

Metallurgical considerations in the production and use of FeTi alloys for hydrogen storage 13 p0033 A77-12777

Survey of hydrogen energy application projects 13 p0033 A77-12778

Performance and cost analysis of photovoltaic power systems for on-site residential applications 13 p0038 A77-12816

A new hydrogen storage electrode 13 p0047 A77-13539

Hydrogen storage via iron-titanium for a 26 MW/e/ peaking electric plant 13 p0048 A77-13543

An alternative fuel for cars --- hydrogen production and storage 13 p0050 A77-14530

High-speed flywheels as possible energy storage devices in the future 13 p0056 A77-15856

Thermal energy storage for heating and air conditioning 13 p0057 A77-16206

The storage of energy in future energy supply systems [DGLR PAPER 76-182] 13 p0059 A77-16533

Energy storage in orbital and interplanetary missions [DGLR PAPER 76-189] 13 p0059 A77-16551

Electric arc power collection for high-speed trains 13 p0060 A77-16594

The influence of subsurface energy storage on seasonal temperature variations 13 p0067 A77-18351

Solar production of hydrogen as a means of storing solar energy 13 p0075 A77-19072

On the storage of solhydrogen 13 p0075 A77-19073

Storage of solar energy in the form of potential hydraulic energy 13 p0075 A77-19078

Electric load management and energy conservation 14 p0137 A77-20685

Fiber glass super flywheels 14 p0157 A77-22143

Energy storage in the form of latent heat 14 p0157 A77-22350

Operational chemical storage cycles for utilization of solar energy to produce heat or electric power 14 p0158 A77-22646

The nickel-zinc battery - A viable alternative for vehicle powering 14 p0160 A77-22894

Direct and indirect economics of wind energy systems relative to fuel based systems 14 p0165 A77-23358

## ENERGY TECHNOLOGY CONTD

NASA thersionic-conversion program 13 p0043 A77-12863

Operational, cost, and technical study of large windpower systems integrated with existing electric utility 13 p0043 A77-12867

Vortex kinetic energy concentrator 13 p0044 A77-12870

Numerical solution for the unsteady lifting characteristics of variable pitch cross-flow wind turbines 13 p0044 A77-12871

Design consideration for the Darrieus rotor --- wind turbines 13 p0044 A77-12872

Operational experience with small wind units 13 p0044 A77-12873

An experimental 200 kW vertical axis wind turbine for the Magdalen Islands 13 p0044 A77-12874

Underground gasification of coal: A National Coal Board reappraisal. 1976 --- Book 13 p0044 A77-12926

An advanced energy conservation technology program; Proceedings of the Intersociety Workshop Conference, Airlie House, Va., March 24-26, 1976 13 p0045 A77-12928

MHD - Energy transformation by burning coal 13 p0045 A77-12940

The U-240 cyclotron --- review of systems and processes 13 p0046 A77-13151

Dependability of wind energy generators with short-term energy storage 13 p0046 A77-13323

A hydride compressor 13 p0046 A77-13336

Life-cycle costs and solar energy 13 p0047 A77-13501

Optimizing solar cooling systems 13 p0047 A77-13502

Atlanta /Towns/ solar experiment - The lessons we learned 13 p0047 A77-13503

Feasibility of a satellite solar power station /SSPS/ 13 p0047 A77-13504

Evaluating a solar energy concentrator 13 p0047 A77-13505

The Shenandoah Community Center - A total solar design concept 13 p0047 A77-13506

Stage efficiency in the analysis of thermochemical water decomposition processes 13 p0047 A77-13538

Windmills stage a comeback --- review 13 p0048 A77-13624

Experiment on MHD generator with a large-scale superconducting magnet /ETL Mark V/ 13 p0049 A77-13728

Some material considerations involved in the application of solar energy to electric power generation 13 p0049 A77-13739

Energy and environment post-2000 13 p0050 A77-14560

Energy consumption in various modes of transportation 13 p0050 A77-14561

Characteristics of a system for transmitting concentrated solar radiation 13 p0051 A77-14578

Energetic calculation of the concentrating capacity of paraboloidal facets 13 p0051 A77-14579

Calculation of the radiation entering a 'hot box' type solar set-up 13 p0051 A77-14581

Scientific-technological problems of the development of a fuel-energy complex in the USSR 13 p0051 A77-14703

Satellite solar power stations and energy relay satellites 13 p0052 A77-14901

Energy: Conversion and utilization --- Book 13 p0052 A77-14957

Can Canada harness the wind 13 p0053 A77-15047

Utilization of solar power - A new departure 13 p0053 A77-15049

Energy research for physicists 13 p0054 A77-15350

The potential for application of energy storage capacity on electric utility systems in the United States. I 13 p0054 A77-15625

Cost aspects of solar energy - Selective and critical bibliography 13 p0054 A77-15799

Studies and thoughts on nuclear reactor systems 13 p0055 A77-15800

Geothermal sources and their utilization 13 p0055 A77-15803

Energy research in the UK 13 p0055 A77-15812

Geothermal power - The 'sleepers' in the energy race 13 p0056 A77-15845

Water power in the immediate future 13 p0056 A77-15850

Possibilities for utilizing wind energy 13 p0056 A77-15853

Space solar power - An available energy source 13 p0056 A77-15946

Future energy production systems: Heat and mass transfer processes. Volume 1 --- Book 13 p0056 A77-16201

Heat and mass transfer for solar energy utilization 13 p0057 A77-16205

Hydrogen production using nuclear heat 13 p0057 A77-16211

Combined cycles and refined coal --- gasification plant using high temperature gas turbines 13 p0058 A77-16249

New England wind power...coastal or mountain 13 p0058 A77-16250

The prospect for fusion --- controlled nuclear fusion 13 p0058 A77-16357

Hydrogen production from water by means of chemical cycles 13 p0058 A77-16471

The storage of energy in future energy supply systems [DGLR PAPER 76-182] 13 p0059 A77-16533

Windmills change direction --- British system utilizing offshore windmills and depleted North Sea fields 13 p0060 A77-16620

Potentialities and limitations of the utilization of wind machines 13 p0061 A77-16787

Superalloys for advanced energy systems 13 p0061 A77-16824

Energy and environmental considerations in extending heat pump applications 13 p0062 A77-17058

Homeowner's guide to solar heating and cooling --- Book 13 p0062 A77-17525

Fossil energy research and development in ERDA 13 p0063 A77-17551

Problems of energy storage in solar power stations 13 p0063 A77-17555

Application of solar energy in the high-temperature range 13 p0063 A77-17636

Geothermal energy development 13 p0064 A77-17801

Increase in the efficiency of heat and power systems using large artificial accumulators of heat 13 p0064 A77-17939

Alkali metal space power technology applicable to national energy research and development [AIAA PAPER 77-289] 13 p0065 A77-18223

Solar power satellites - Opportunity and challenge [AIAA PAPER 77-291] 13 p0065 A77-18224

The application of aerospace technology to solar thermal electric power generation [AIAA PAPER 77-294] 13 p0065 A77-18226

OTEC - Aerospace and ocean engineering in partnership --- Ocean Thermal Energy Conversion [AIAA PAPER 77-296] 13 p0066 A77-18227

Gas turbine electric powerplants [AIAA PAPER 77-346] 13 p0066 A77-18254

Perspectives on Satellite Solar Power [AIAA PAPER 77-352] 13 p0066 A77-18257

Parametric studies of the thermal trap flat plate collector 13 p0068 A77-18443

Overview of the ERDA fusion power program 13 p0068 A77-18446

Coal liquefaction with soluble transition-metal complexes 13 p0070 A77-18584

The future importance of solar energy for the supply of the German Federal Republic with energy 13 p0070 A77-18597

A solar house with heat pipe collectors 13 p0070 A77-18598

Heliotechnique and development; Proceedings of the International Conference, Dhahran, Saudi Arabia, November 2-6, 1975. Volumes 1 & 2 13 p0072 A77-19043

Performance of an annular cylindrical solar collector 13 p0073 A77-19059

Solar water heater using hardened black polythene pipe absorbers 13 p0073 A77-19060

Solergy collector concept --- immobile reflective surface for solar collection using spiral concentrator 13 p0073 A77-19061

Double-reflection solar energy concentrators 13 p0074 A77-19067

Periodically adjustable concentrators adapted to solar cell panels 13 p0074 A77-19068

Stationary solar concentrators for industrial heating and cooling 13 p0074 A77-19069

Cylindrical mirror collector field 13 p0074 A77-19071

Solar production of hydrogen as a means of storing solar energy 13 p0075 A77-19072

Photovoltaic effect applications 13 p0075 A77-19080

Photovoltaic systems using sunlight concentration 13 p0076 A77-19089

Double-faced silicon solar cell system 13 p0076 A77-19090

Electric energy from atmospheric water vapor 13 p0077 A77-19097

The two enemies of industrial development of solar energy - Simplicity and economy 13 p0078 A77-19109

Heating a building by means of solar and electrical energy 13 p0078 A77-19113

New frontiers in solar and other energy options 13 p0079 A77-19118

Improved use of energy --- through waste and solar energy utilization 13 p0079 A77-19123

The role of solar energy in developing nations - The perspectives in Mali 13 p0080 A77-19125

Research at the EURATOM-CCB Center --- on solar energy 13 p0080 A77-19126

Solar energy in Switzerland 13 p0080 A77-19127

Problems of transportation power plants 14 p0136 A77-20004

Wind power --- wind-powered plant design 14 p0136 A77-20042

Coal gasification and its relation to tested power plants 14 p0136 A77-20074

Principles of atomic central heating 14 p0136 A77-20102

Flue gas desulfurization experience 14 p0136 A77-20381

The energy crisis today - A perspective 14 p0137 A77-20390

Deashing of coal liquefaction products via partial deasphalting. I - Hydrogen-donor extraction effluents. II - Hydrogenation and hydroextraction effluents 14 p0138 A77-20725

On the solar energy problem --- for heat and electric power production 14 p0138 A77-20742

Joint test of an U.S. electrode system in the U.S.S.R. U-02 facility 14 p0139 A77-21215

Utilization of Western coal for MHD energy conversion 14 p0140 A77-21230

Development of a baseline reference design for an open cycle MHD power plant for commercial service 14 p0140 A77-21232

The technology base for large MHD superconducting magnets 14 p0140 A77-21233

Progress on the Mark VI long-duration MHD generator 14 p0141 A77-21237

Experimental investigation on a direct coal-fired MHD generator 14 p0141 A77-21238

System studies of coal fired-closed cycle MHD for central station power plants 14 p0142 A77-21267

Liquid-metal MHD coupled to coal-fired fluidized-bed combustors 14 p0143 A77-21269

The quality category in solar engineering 14 p0143 A77-21310

Conversion of solar energy by photosynthetic production of molecular hydrogen 14 p0143 A77-21316

Superconducting magnets for an MHD test facility and base load power plant 14 p0144 A77-21379

Superconducting a.c. generators - Progress on the design of a 1300 MW, 3000 rev/min generator 14 p0144 A77-21386

Wind energy for human needs 14 p0145 A77-21400

Wide-range control of a thermal interconnection network --- waste incineration utilization supplying pipelined steam heat 14 p0145 A77-21545

Alcohol - A Brazilian answer to the energy crisis --- automobile fuel from manioc 14 p0145 A77-21673

Solar photothermal power generation 14 p0146 A77-21700

Research on battery-operated electric road vehicles 14 p0146 A77-21701

Is commercial coal conversion practical 14 p0146 A77-21761

Technology of large area Cu/x/S-CdS solar cells 14 p0149 A77-21798

Hydrogen production by photoelectrochemistry in visible light 14 p0150 A77-21813

Method of investigation, experimental results, and optimization criteria for photoelectrochemical converters 14 p0151 A77-21814

Interaction between the solar mirror field and the thermodynamic system of a turning solar power plant 14 p0151 A77-21824

Thermal optimization of steam generating systems for tower type solar steam power plants - Tasks and methods 14 p0152 A77-21830

The solar tower as a source of thermal electric energy 14 p0152 A77-21831

Status report on the German experimental study for terrestrial solar electric generators 14 p0153 A77-21836

A power plant of the Aerosolec type 14 p0153 A77-21839

Development of a 10 kWe solar thermal power station 14 p0154 A77-21844

Potentialities of electric energy production by means of thermoelectric generators 14 p0154 A77-21847

Photovoltaic conversion of solar energy using optical concentration systems 14 p0154 A77-21849

Effect of the characteristics of electrical supply networks on the design of solar power plants 14 p0155 A77-21858

Combined gas/steam cycle power and heat generating plants 14 p0155 A77-22023

# SUBJECT INDEX

# ENERGY TECHNOLOGY CONTD

Small gas turbines and the Total Energy concept  
14 p0156 A77-22024

The principles of system studies in nuclear energy  
research  
14 p0157 A77-22342

Four different views of the heliostat flux density  
integral  
14 p0158 A77-22645

Economic competitiveness of solar energy with  
conventional fuels and electricity  
14 p0158 A77-22648

Solar energy concentration with liquid lenses  
14 p0158 A77-22649

Applications of cryogenic technology. Volume 8 ---  
Book  
14 p0159 A77-22868

Traction batteries for existing and future  
electric road vehicles  
14 p0159 A77-22878

User experience with the Enfield car --- electric  
motor vehicle  
14 p0159 A77-22884

The M.A.N. electrobus experience gained in  
large-scale tests  
14 p0160 A77-22900

New energy systems - Associated thermodynamic cycles  
--- French book  
14 p0162 A77-22924

Research and development of geothermal energy  
production in Hungary

Status and outlook of controlled nuclear fusion  
14 p0163 A77-23095

Path of development and developmental status of  
the lignite high-temperature coking process in  
the DDR - An example of effective utilization of  
lignite as energy vehicle  
14 p0163 A77-23096

Mathematical simulation of the fixed-bed  
pressurized gasification process  
14 p0164 A77-23097

Hydrocarbon cracking developments in the DDR  
14 p0164 A77-23098

On the production of town gas from off-gases of  
the chemical processing industry  
14 p0164 A77-23099

Solar energy conversion - Work experience of a  
team applying methods and techniques of physics  
research to this sector  
14 p0164 A77-23296

Design and testing of planar solar collectors  
14 p0164 A77-23298

Advanced technologies for photovoltaic cell  
fabrication  
14 p0165 A77-23300

Fuel cells - Prospects of their applications for  
electric utilities  
14 p0165 A77-23306

The energy situation in Canada  
14 p0165 A77-23307

Low-Btu gas from coal has many potential markets  
14 p0165 A77-23309

Aspects of surface wind behaviour  
14 p0165 A77-23357

Direct and indirect economics of wind energy  
systems relative to fuel based systems  
14 p0165 A77-23358

A possible saturation criterion for wind energy  
extraction  
14 p0165 A77-23359

Large scale Wind Energy Conversion System /WECS/  
design and installation as affected by site wind  
energy characteristics, grouping arrangement and  
social acceptance  
14 p0165 A77-23360

Engineering development status of the Darrieus  
wind turbine  
14 p0166 A77-23365

Pumped-storage electric power generating plants  
14 p0166 A77-23373

Can new resources fill the energy gap  
14 p0166 A77-23380

Periodically adjustable concentrators adapted to  
solar cell panels  
14 p0166 A77-23385

The dilemma of future electric power demand  
14 p0167 A77-23391

The ASHRAE monograph on applications of solar  
energy for heating and cooling buildings  
14 p0167 A77-23441

Design application using solar energy to control  
the environment in a major office building  
14 p0168 A77-23442

Solar absorption air-conditioning performance in  
central Ohio  
14 p0168 A77-23443

The use of commercially available absorption units  
on solar-powered cooling systems  
14 p0168 A77-23445

The national laser-fusion program  
14 p0168 A77-23502

Fuel cells - A sleeper in the energy race  
14 p0170 A77-23647

Why solar energy --- advantages over fossil fuel  
and nuclear energy  
14 p0170 A77-23654

A progress report on the national program for  
solar heating and cooling  
14 p0170 A77-23656

International cooperation on development of  
hydrogen technologies
